FOREWORD

The planning and design of water resources projects require time series data on hydrological aspects. The basic hydrological data on gauge, discharge, silt, sedimentation and water quality are regularly collected at hydrological observation stations of CWC and processed. Thereafter the authenticated data is transmitted to the CWC regional field offices which document it in the form of Water Year Book, Sediment Year Book and Water Quality Year Book.

In an endeavour to provide suitable statistics for informed decision making in respect of hydrological data (unclassified rivers), I am happy to note that the current publication has improved substantially by including additional aspects like quality charts showing variation across river sites, river flow line diagram of various river basins etc.

The contribution of Shri Ravi Shankar, Chief Engineer (Planning & Development) as the Chairman of the Committee for improvement of this publication, Shri D.C.Sharma, Ex-Advisor (ISO) as Member Secretary of the Committee and Ms. Jiju Kurian, Advisor (ISO) is highly appreciable. The assistance provided by Shri Pankaj Sharma, Director and Dr. Niyati Joshi, Joint Director and their team is appreciated.

I hope this publication would be useful for research scholars, planners, policy makers and various stake holders at large. Any suggestion and feedback for further improvement in content and quality of this publication would be welcome.

(S. Masood Husain)

PREFACE

Water Resources planning requires time series data on hydrological aspects. The Hydrological Observation Divisions of CWC collect and process the basic hydrological data on gauge, discharge, silt, sedimentation and water quality on a regular basis for onward transmission to the CWC regional field officers, who document it in the form of Water Year Book, Sediment Year Book and Water Quality Year Books. Hydrological Data (Unclassified) Book is a compendium of important information of all basins pertains to Region-III consolidated at the national level.

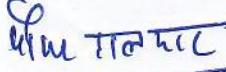

The publication presents salient features of all basins of Region-III relating to location, drainage area, soil characteristics, type of industries, principal minerals, rainfall, temperature, type of climate, average annual run off, seasonal water flow, historical water levels, live storage capacity, annual flow of water into river basin, dependable flow of water in different river basins, ten daily & monthly sediment load for different river basins, critical absolute values of water quality parameter, land use statistics etc.

The present issue of the data book provides updated basin/site-wise data of river basins (Region-III) covering aspects such as location, drainage area, temperature, average runoff, seasonal water flow, historical water levels, average sediment load, water quality parameters and land use statistics.

The publication is intended to provide documentation of available data in the form required by the researchers and analyst.

I hope this publication will be useful for all interested in the subject. Suggestions, if any, will be highly appreciated for improvement of the publication.

Executive Summary

The nation can be divided into following three regions; (a) Region-I: Indus basin & other rivers and their tributaries discharging into Pakistan; (b) Region-II: Ganga-Brahmaputra-Meghna basin & other rivers and their tributaries discharging into Bangladesh/Myanmar; and (c) Region-III: Remaining other rivers and their tributaries.

The data of Region-I and II are classified, whereas the data of Region-III is unclassified. The reservoir water level, live storage position, water quality, groundwater and meteorological data for all regions are also unclassified.

The Chapter on Introduction describes the scope of this publication and gives a complete list of region - III basins. It also gives briefly an assessment of water resources and an account of per capita availability of water.

The chapter on Overview of the river basins (Region – III) covers 16 basins. It describes salient features of each basin like geographical location, topology, topography, major tributaries, soil characteristics, availability of minerals, major industries, urban centers and important irrigation projects. Further, it gives an account of average annual flow, estimated utilizable flow and total storage capacity in different river basins.

It also covers drainage area, hydrological observation sites and peak water level in different basins. Annual dependable flow of water at terminal sites of all river basins covered in the publication has been described for the last ten years.

Water quality statistics has been presented as per IS 2296-1992. The tolerance limits of parameters of all tolerance factors of water have been indicated in respect of five classes that have been put to various uses of water. The five classes are as follows: Class A - Drinking water source without conventional treatment but after disinfection, Class B - Outdoor bathing, Class C - Drinking water source with conventional treatment followed by disinfection, Class D - Fish culture and wild life propagation, Class E - Irrigation, industrial cooling or controlled wastes or controlled waste disposal. Season-wise and site-wise detailed information on critical absolute values that decides the range of tolerance limits of water quality for Class A has been presented. Also, site-wise information of maximum and minimum values of water quality parameters during the year 2014-2015 and temporal trends of water quality parameters have been presented for pH, Biological Oxygen Demand, Dissolved Oxygen and Total Hardness.

Land use statistics have been presented in the form of land utilization pattern of the river basins (Region - III), gross and net area irrigated by sources and by river basins.

The Appendix contains the tables on Storage capacity by river basin, Salient features of different river basins, Number of hydrological observation sites by basin (Region - III), Important historical observation by sites and river basin, Flow of water by season, site and river basin, Maximum and minimum observed water levels and discharges by site and river basin, Annual dependable flow of water by site and river basin, Monthly average flow per unit drainage area by site and river basin, Time series of Sediment load by site in river basin, Ten-daily and monthly average sediment load by site and river basin, Tolerance limits of selected water quality parameters for inland surface water by its use, Critical absolute values of water quality parameters crossing tolerance limits by season, Maximum and minimum values of water quality parameters by site and river basin, Land utilization pattern by river basin and State, Area irrigated (source wise) in each district of state by river basin and basic parameters of Ground water resource availability, utilization and stage of development .

Chapter 1

Introduction

1.0 Background

1.0.1 Information System Organisation (ISO) of Water Planning & Projects Wing (WP&P) in CWC is a statistical unit of CWC entrusted in compiling data collected by CWC field offices and bringing out publications for backing up data for planning and policy formulation and researchers relating to water resources. Among these publications, the present one is on hydrological data entitled “Hydrological Data (Unclassified) Book”.

1.0.2 River management is one of the key issues for political and economic affairs of the country. Planners and policy makers require a comprehensive and reliable time series data on hydrological aspects. The primary objective of this data book is to provide data that will help in designing and execution of water resource projects in the country.

1.0.3 From the point of view of data dissemination, the nation can be divided into following three regions; (a) Region-I: Indus basin & other rivers and their tributaries discharging into Pakistan; (b) Region-II: Ganga-Brahmaputra-Meghna basin & other rivers and their tributaries discharging into Bangladesh/Myanmar; and (c) Region-III: Remaining other rivers and their tributaries.

The data of Region-I and II are classified, whereas the data of Region-III is unclassified. The reservoir water level, live storage position, water quality, groundwater and meteorological data for all regions are also unclassified. The scope of this publication is limited to data (unclassified) pertaining to the region-III basins only. The river basins (Region – III) for the purpose of this publication are listed below.

1. Mahanadi
2. Subernarekha
3. Brahmani and Baitarani
4. Godavari
5. Krishna
6. Cauvery
7. Pennar
8. East flowing rivers between Mahanadi to Pennar
9. East flowing rivers between Pennar to Kanyakumari
10. Narmada
11. Tapi
12. West flowing rivers from Tapi to Tadri
13. West flowing rivers from Tadri to Kanyakumari
14. Mahi
15. Sabarmati
16. West flowing rivers of Kutch, Saurashtra including Luni

The descriptions of these river basins (Region-III) are given in Chapter 2.

1.0.4 The nation-wide data collection network of CWC is spread over 1131 hydrological observation (H.O) stations (878 H.O station opened upto XII Plan and 253 out of 800 new H.O Station opened during XII Plan) covering both classified and un-classified river basins (as on 31.03.2016). Out of these, 417 operational sites are located in region-III basins. The distribution of the sites by river basin (Region-III) has been presented in Table 3 for the year 2014-15. In these sites, hydrological data on gauge, discharge, silt, sedimentation, water quality and water flow are collected regularly.

1.0.5 Based on the data collected in the field, three water year books for gauge and discharge, sediment and water quality are prepared by CWC field office at divisional level. All these books along with some relevant land use statistics collected by the Ministry of Agriculture & Farmers Welfare are integrated in this data book.

1.1 Assessment of Water Resources

1.1.1 The annual precipitation including snowfall is the main source of water in India and the average is estimated to be of the order of 4000 cu km. The total water resource potential of the country, which occurs as natural run off in the rivers is estimated at 1869 cu km considering both surface and groundwater into account. Due to various constraints of topography, uneven distribution of resource over space and time, it has been estimated that only about 1123 cu km can be put to beneficial use – out of which only 690 cu km is surface water. However, 370 cu km of estimated utilizable surface water comes from the region-III river basins.

1.2 Per Capita Availability of Water

1.2.1 As per the distribution of water resources potential in the country, the national per capita annual availability of water is 1545 cu m (estimated as on 1st March 2011). The estimated per capita average availability during the year 2010 in Brahmaputra system was 13407 cu m while it was as low as 263 cu m in Sabarmati basin. The per capita availability in the country was 1608 cu m during 2010. Any situation of availability of less than 1000 cu m per capita is considered by international agencies as scarcity conditions.Krishna, Cauvery, Subernarekha, Pennar, Mahi, Sabarmati, Tapi, East Flowing Rivers and West Flowing Rivers of Kutch and Saurashtra including Luni are some of the basins, which fall into this category- out of which Cauvery, Pennar, Sabarmati and East Flowing rivers and West Flowing Rivers of Kutch and Saurashtra including Luni facing more acute water scarcity with per capita availability of water less than or around 500 cu m.

This book contains data for 2014-15. Wherever time series data are presented, it covers a period of ten years from 2005-06 to 2014-15.

Chapter 2

Overview of the River Basins (Region-III)

This chapter gives a detailed account of all river basins pertaining to Region-III only. It may be mentioned that Indus basin & other rivers and their tributaries discharging into Pakistan pertain to Region-I; Ganga-Brahmaputra-Meghna basin & other rivers and their tributaries discharging into Bangladesh/Myanmar pertain to Region-II. Remaining other rivers and their tributaries pertain to Region-III.

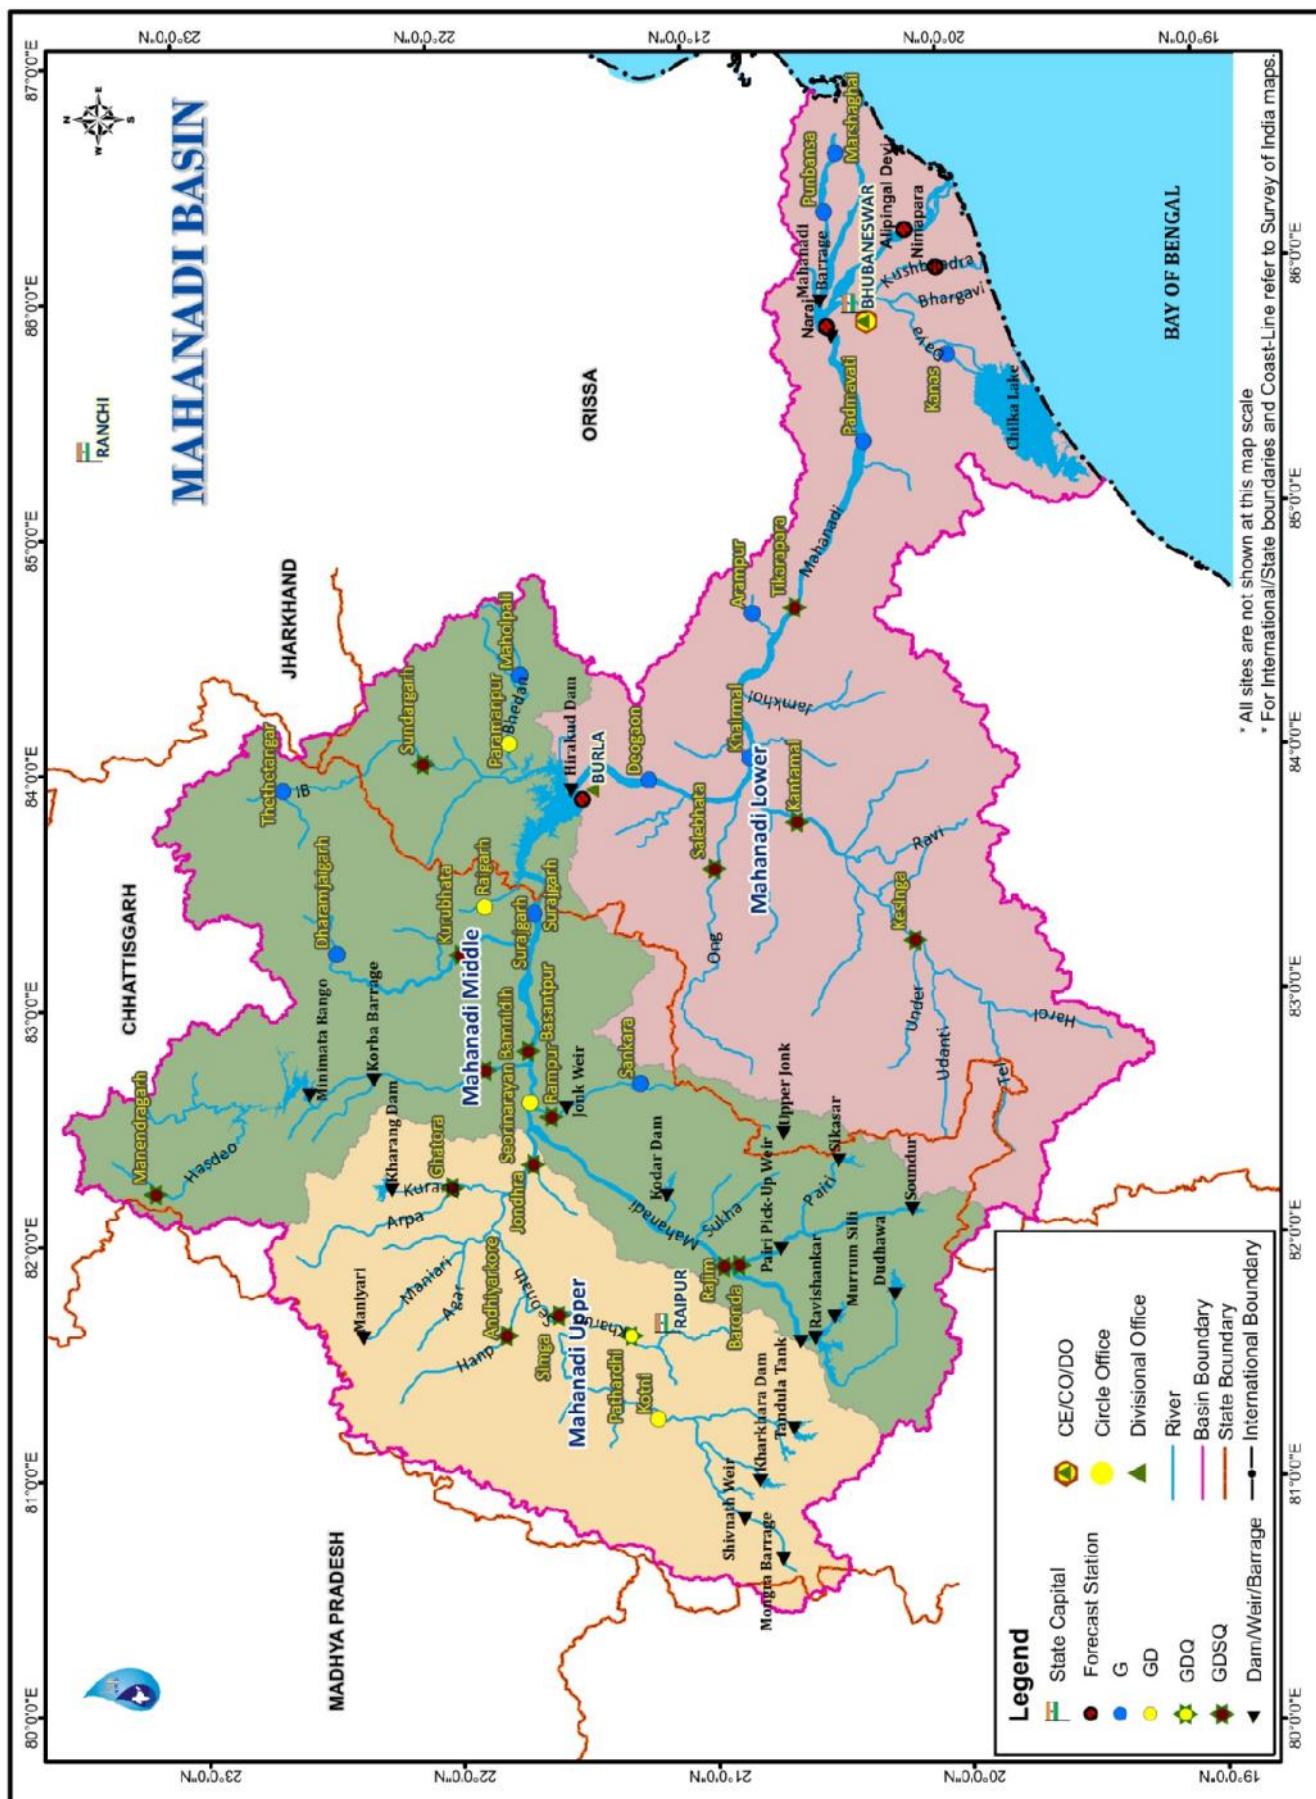

- It covers salient features like geographical location, topology, topography, major tributaries, soil characteristics, availability of minerals, major industries, urban centres and important irrigation projects including observation sites. Basin-wise detailed information is presented in Table 2 of Appendix.
- It provides the flow line diagram of the basin which gives a fair idea about the major projects, hydrological observation sites and tributaries of the main river.
- It depicts the annual dependable flow (10%, 25%, 50%, 75%, 90%, 100%) at terminal sites of the basin. Basin-wise detailed information is presented in Table 7 of Appendix.
- It gives the season-wise (monsoon, winter, summer) temporal trends of water quality parameters viz. pH, BOD (Biological Oxygen Demand), DO (Dissolved Oxygen) and Total Hardness at selected sites of the basins. Basin-wise detailed information is presented in Table 13 of Appendix.
- It provides information on land use statistics viz. land utilisation pattern (forest, fallow land, cropped area etc.), Gross and Net area irrigated of the basin. Basin-wise detailed information is presented in Table 14, Table 15 and Table 16 of Appendix.

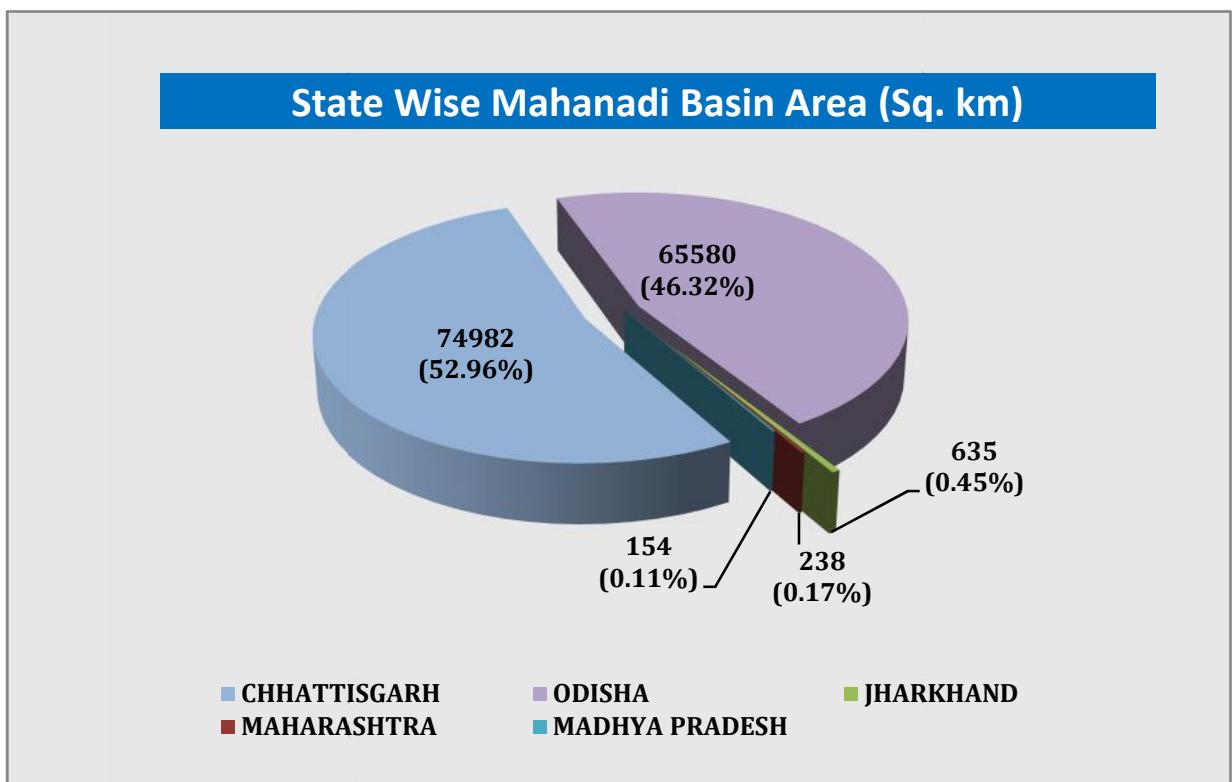

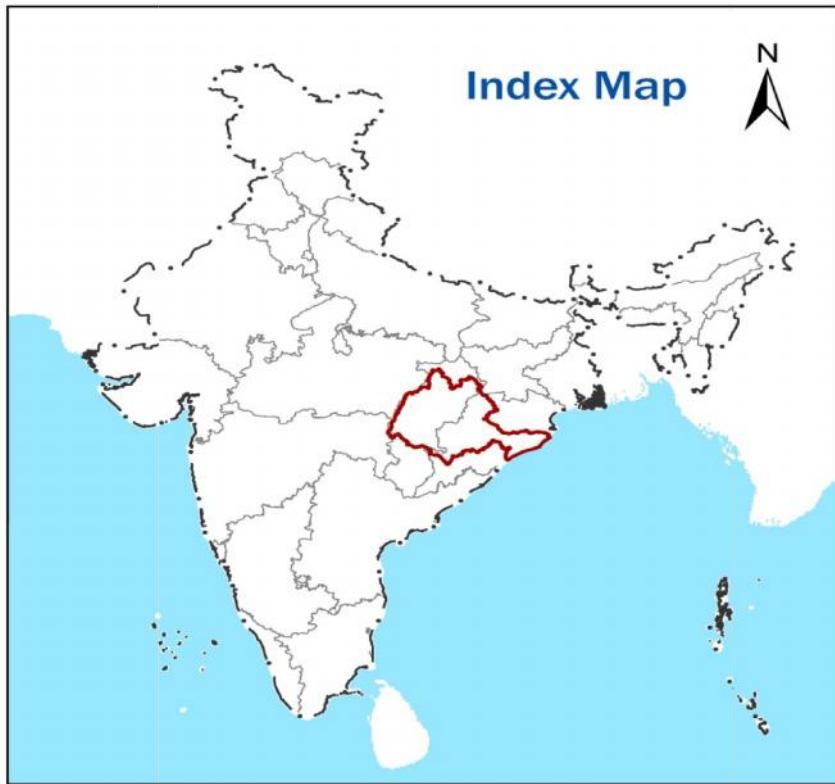

2.1 MAHANADI BASIN

Location: The basin is physically bounded in the north by Central India hills, in the south and east by the Eastern Ghats and in the west by Maikala hill range. The Chiroli Hills form the watershed dividing the Wainganga valley from the Mahanadi Basin, the upper portion of which is designed as the Chhattisgarh Basin. The Mahanadi basin lies encompassed within geographical co-ordinates of $80^{\circ}28'$ to $86^{\circ}43'$ east longitudes and $19^{\circ}8'$ to $23^{\circ}32'$ of north latitudes running a total length of about 851 km. The total catchment area of the basin is 141589 sq km which is nearly 4.3% of the total geographical area of the country. The basin extends over Chhattisgarh and Odisha and comparatively smaller portions of Madhya Pradesh, Jharkhand and Maharashtra.

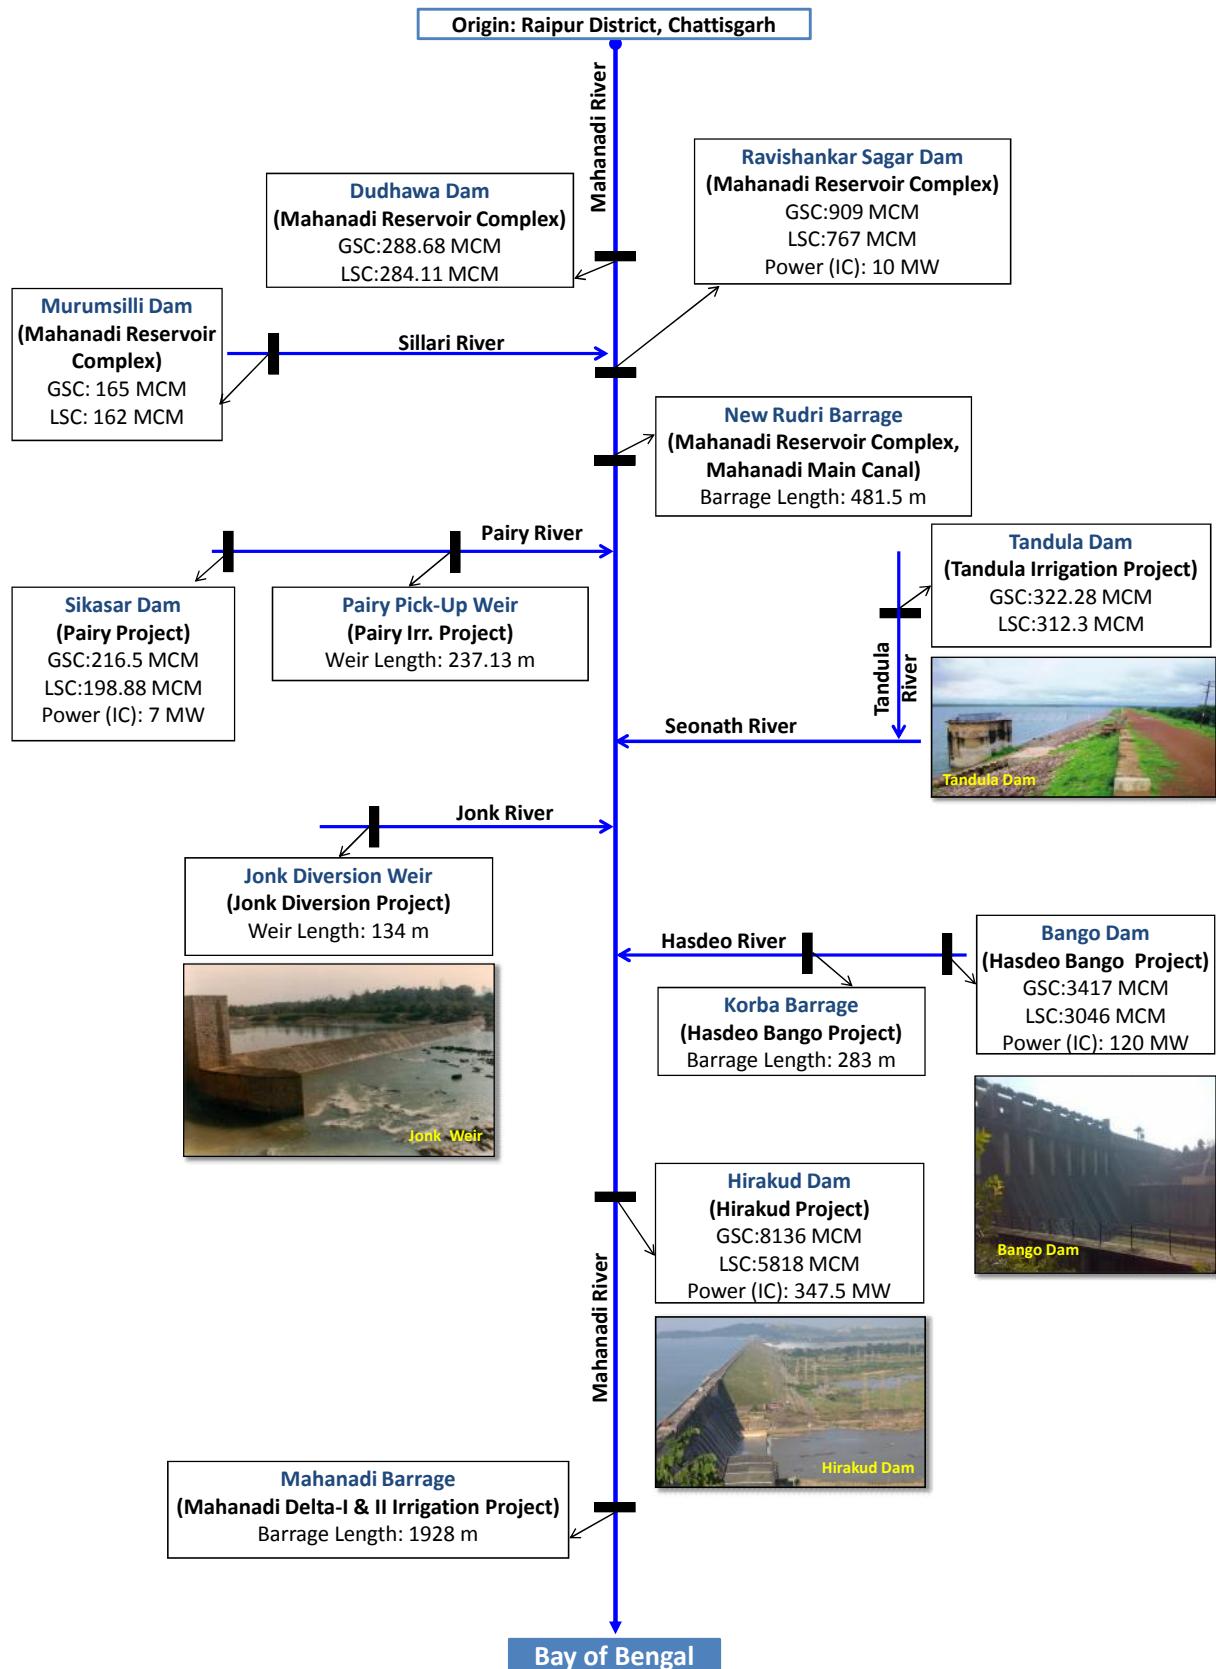

The river Mahanadi is one of the major inter-state east flowing rivers in peninsular India. It originates at an elevation of about 442 metre above Mean Sea Level (msl) near Farsiya village near Nagri town in Dhamtari district of Chhattisgarh. The total length of the river from its origin to confluence at the Bay of Bengal is about 851 km, of which 357 km is in Chhattisgarh and the balance 494 km in Odisha. During its traverse, a number of tributaries join the river on both the banks. There are 14 major tributaries of which 12 are joining upstream of Hirakud reservoir and 2 downstream of it.

On the left bank six tributaries namely the Seonath, the Hasdeo, the Mand, the Ib, the Kelo and Borai drain into main channel upstream of Hirakud reservoir. On the Right Bank six tributaries namely the Pari, the Jonk, the Sukha, Kanji, the Lilar and the Lath join upstream of Hirakud reservoir and two tributaries namely Tel and Ong join downstream of it. The three major tributaries namely the Seonath and the Ib on the Left Bank and the Tel on the Right Bank together constitute nearly 46.63% of the total catchment area of the river Mahanadi. The Seonath, which is the largest tributary of Mahanadi, rises from an elevation of 533 metre in village Kotgai, District Durg (Chhattisgarh) and drains three districts of Chhattisgarh namely Durg, Rajnandgaon and Bilaspur. The Tel, which is the second largest tributary of Mahanadi River, rises from an elevation of 700 metre in village Jorigam of Nabarangpur district of Odisha and drains five districts of Odisha namely Nabarangpur, Kalahandi, Bolangir, Boudh and Kandhamal. The Ib, which is the third largest tributary of Mahanadi, rises from an elevation of 762 metre in village Pandrapat, District Raigarh (Chhattisgarh) and drains Raigarh and Jashpur districts of Chhattisgarh, along with two districts of Odisha, namely Sundergarh and Sambalpur. The monsoon is the principal rainy season, when over 75% of the annual rainfall is received over a major portion of the basin with July/August as the雨iest month. The average annual rainfall of the basin is of the order of 1400 mm.

Mahanadi River Flow Line Diagram

2.1.1 Irrigation Projects: The Major Projects namely Tandula, Mahanadi main Canal, Hirakud Dam, Barrage, Kharang Tank, Manairi Tank, Hasdeo Bango Dam, Tairi, Kodar, Salaki, Ong Diversion and Sunder Dam fall in the catchment areas of the river basin.

2.1.2 Hydrological Observation Sites: The Central as well as the State Governments carry out periodic measurements of hydrological observations. The CWC maintains 54 sites in the basin out of which Gauge in 48 sites and Discharge in 22 sites are made. In 18 stations, sediment observations are also carried out (as per 2014-15 data).

2.1.3 Peak Water Level: There are 20 sites in the basin for which historical observations are given. The reference period varies site to site starting from 1972 to 2015. The maximum drainage area 1,24,450 sq km is covered by Tikrapara site in the basin while Mahendragarh site covers minimum drainage area i.e. 1,100 sq km. The maximum stage of peak water i.e. 420.44 metre is observed at Mahendragarh site on 12.07.1990. On the other hand, Tikrapara site has registered minimum peak water level i.e. 74.57 metre on 10.09.2011.

2.1.4 Water Quality Statistics: As per IS 2296-1992, the tolerance limits of parameters of all polluting factors of water have been indicated in the Tables-11 in respect of the following five classes that have been formed according to various uses of water.

- Class A: Drinking water source without conventional treatment but after disinfection
- Class B: Outdoor bathing
- Class C: Drinking water source with conventional treatment followed by disinfection
- Class D: Fish culture and wild life propagation
- Class E: Irrigation, industrial cooling or controlled wastes or controlled waste disposal.

Considering importance of water quality, an attempt has been made to present seasonwise and site-wise detailed information on critical absolute values that are outside the range of the tolerance limits of water-quality for class-A. These values of water quality parameters have been presented in Table 12.

Site-wise information on maximum and minimum values of water quality parameters during the year 2014-15 for reviewing the kind of water being discharged/ supplied for different purposes have been presented in Table 13.

Temporal trends of water quality parameters for the Mahanadi river basin are given below.

Basin: Mahanadi (Water Quality Parameter : pH)

Fig 2.1.1 : Seasonal 7 years trend (2008 to 2014) during Monsoon(Jun-Oct) for pH at Mahanadi Basin

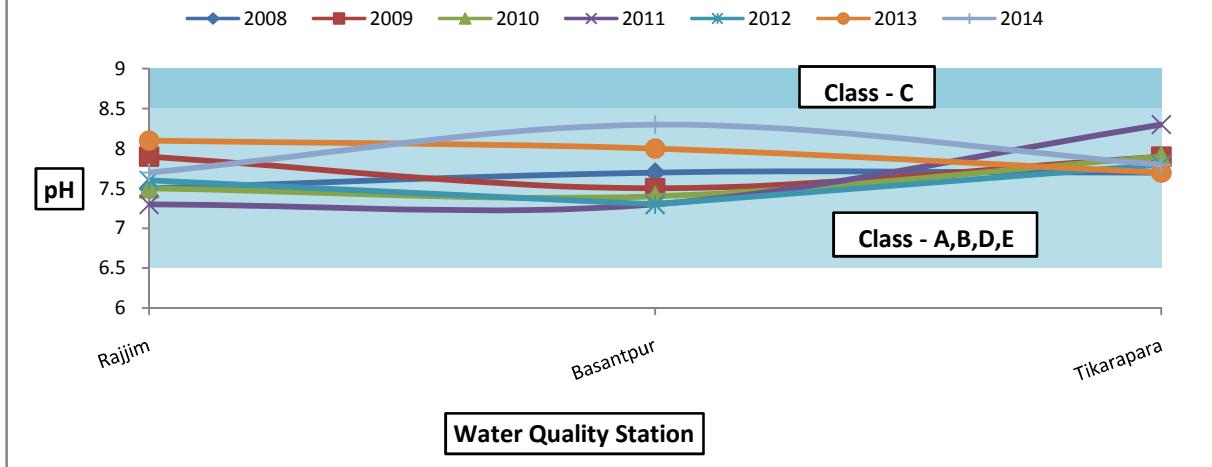

Fig 2.1.2 : Seasonal 7 years trend (2008 to 2014) during Winter(Nov-Feb) for pH at Mahanadi Basin

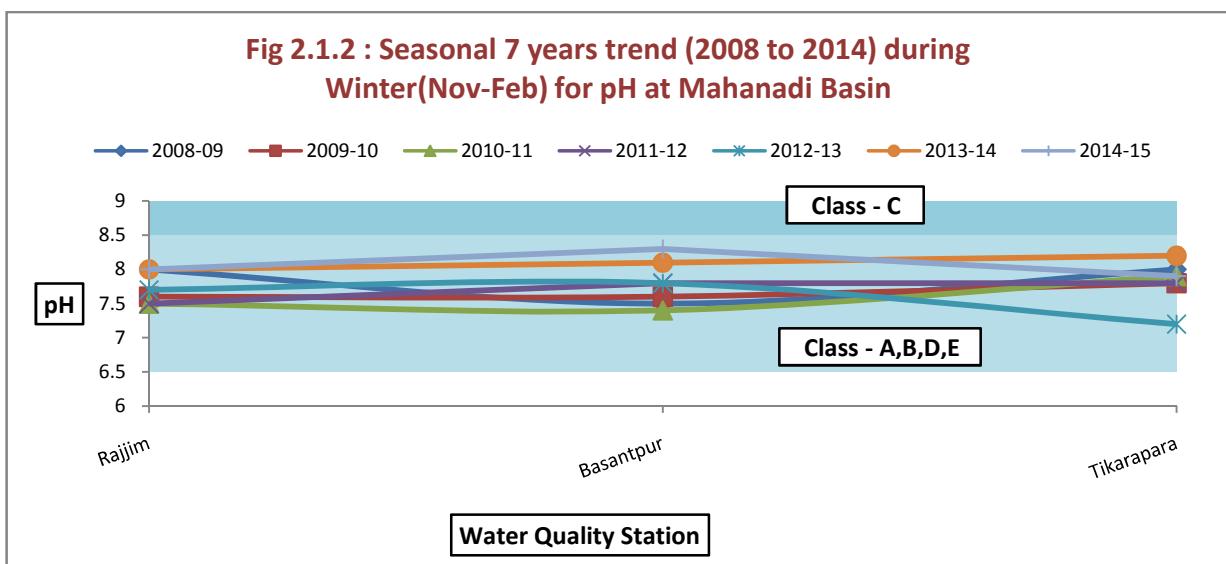

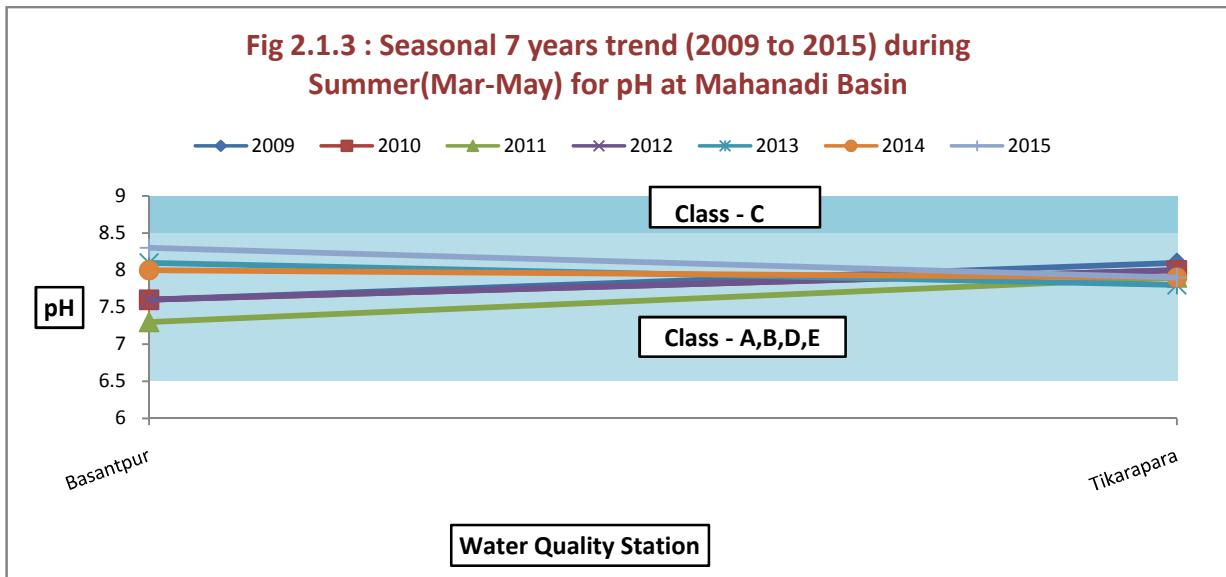

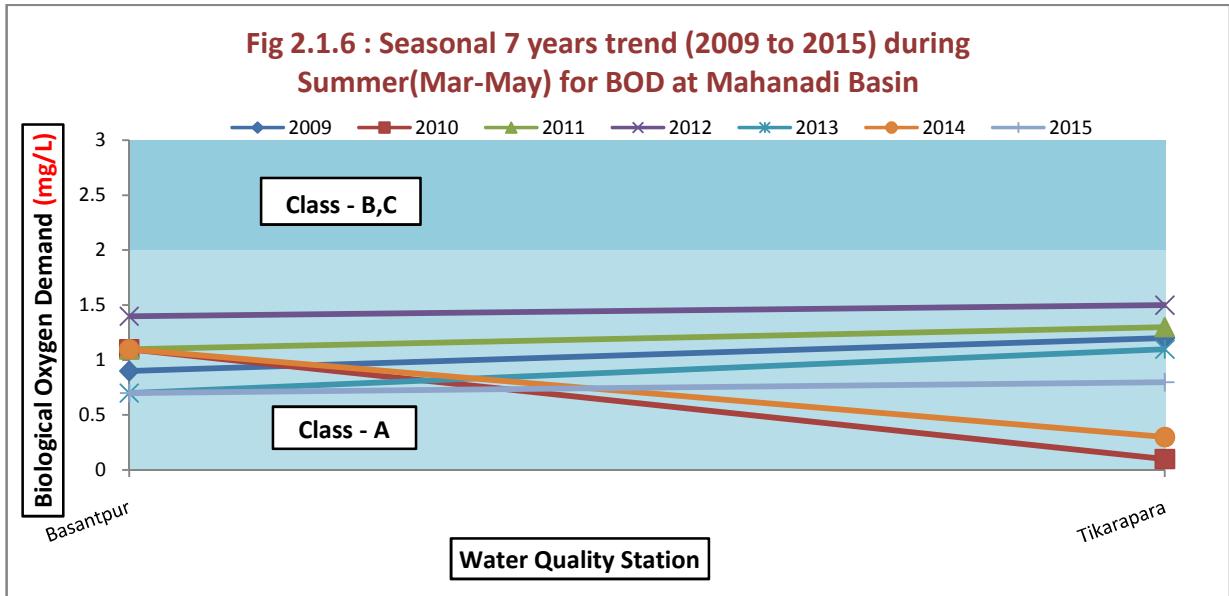

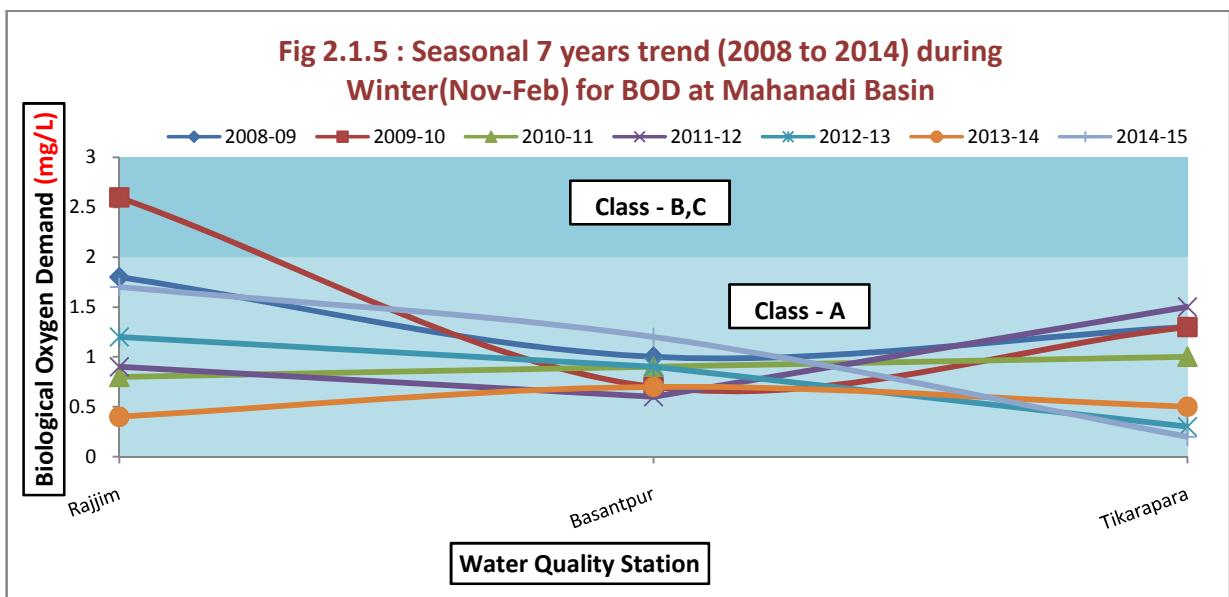

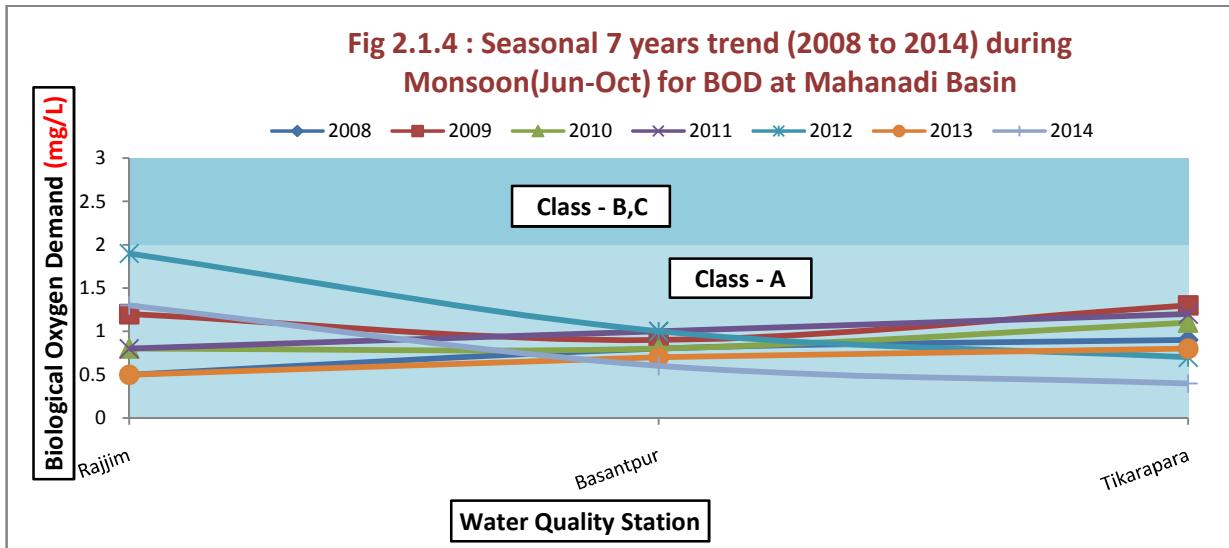

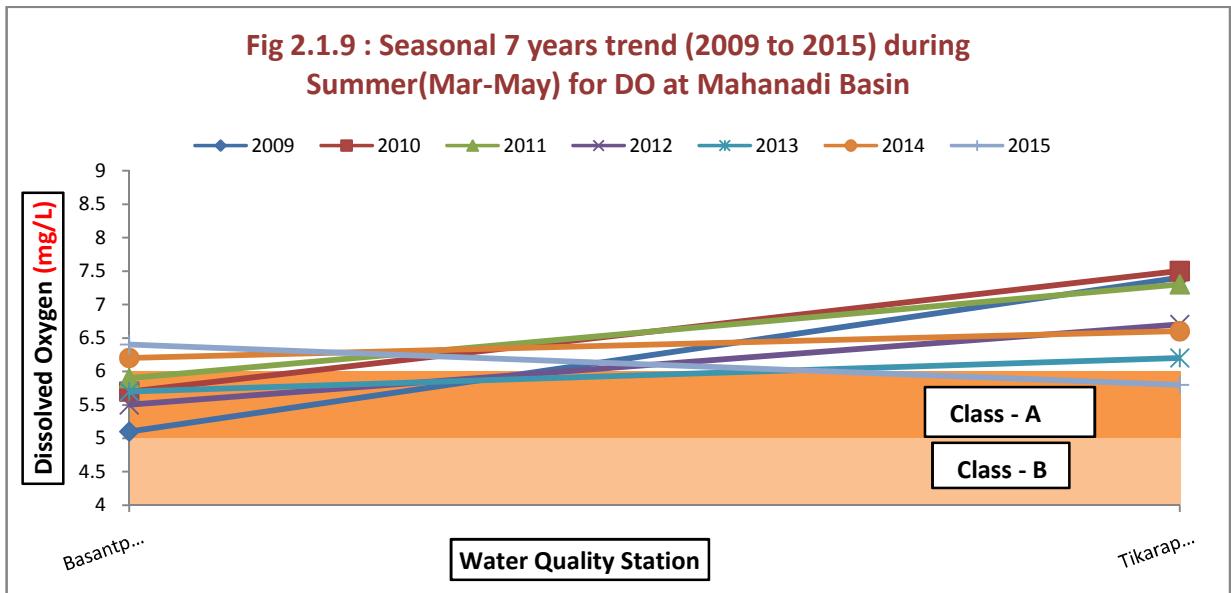

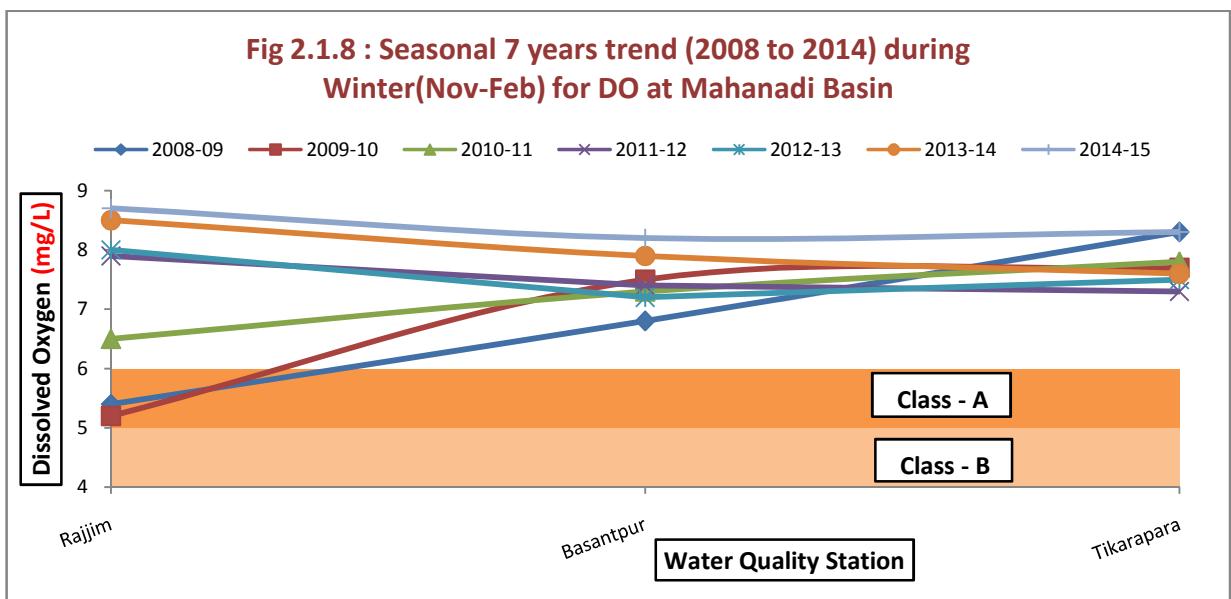

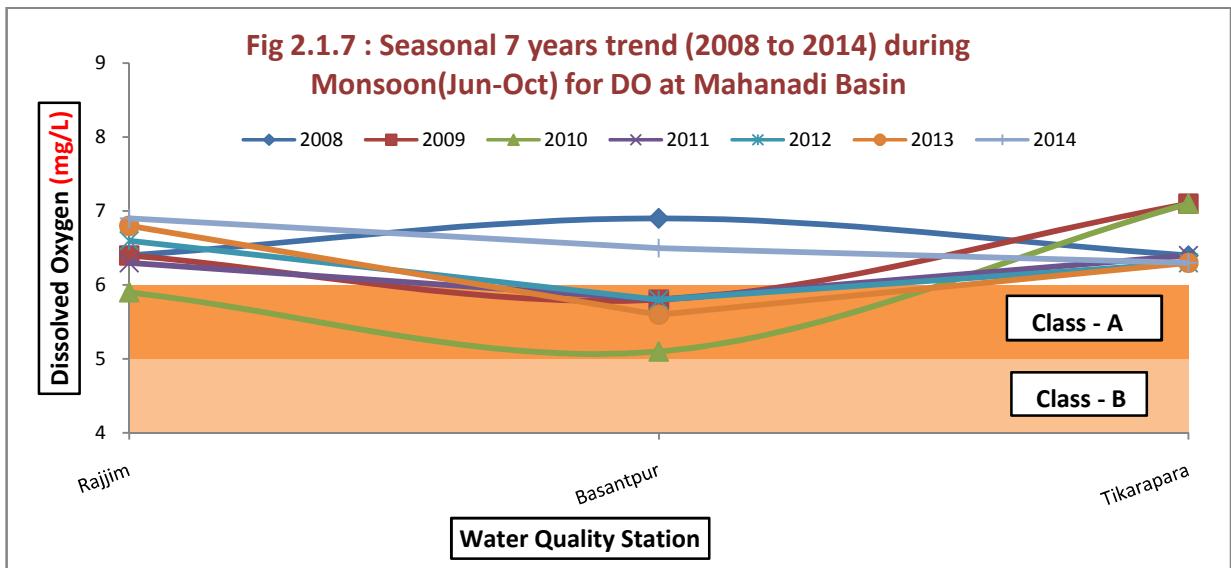

Fig 2.1.3 : Seasonal 7 years trend (2009 to 2015) during Summer(Mar-May) for pH at Mahanadi Basin

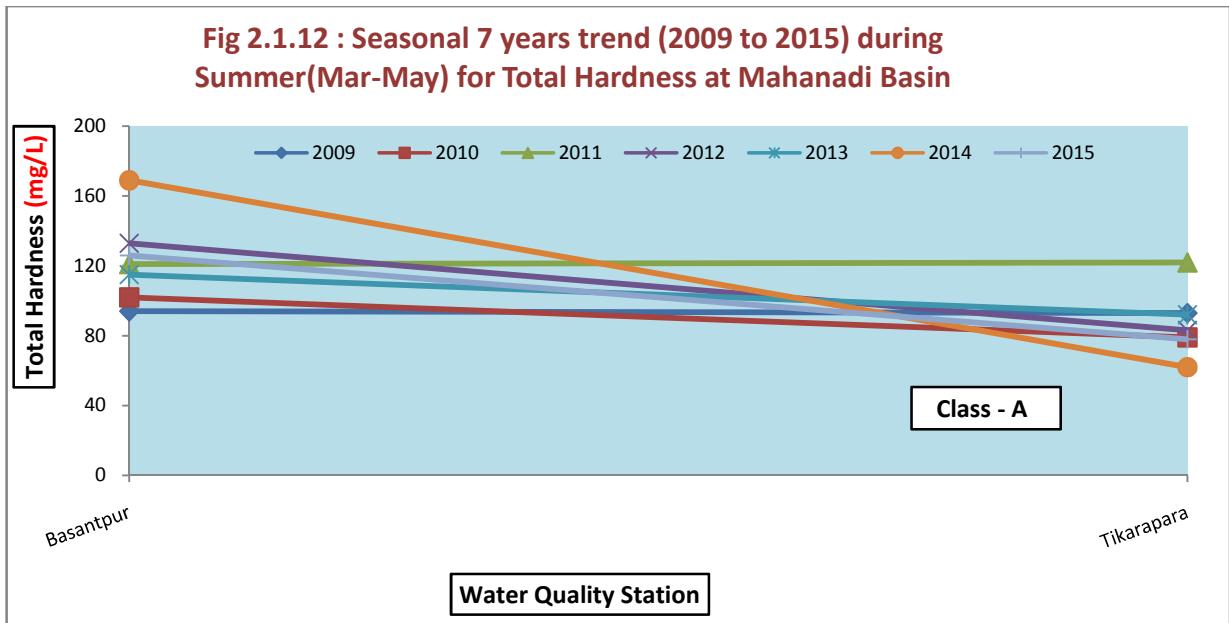

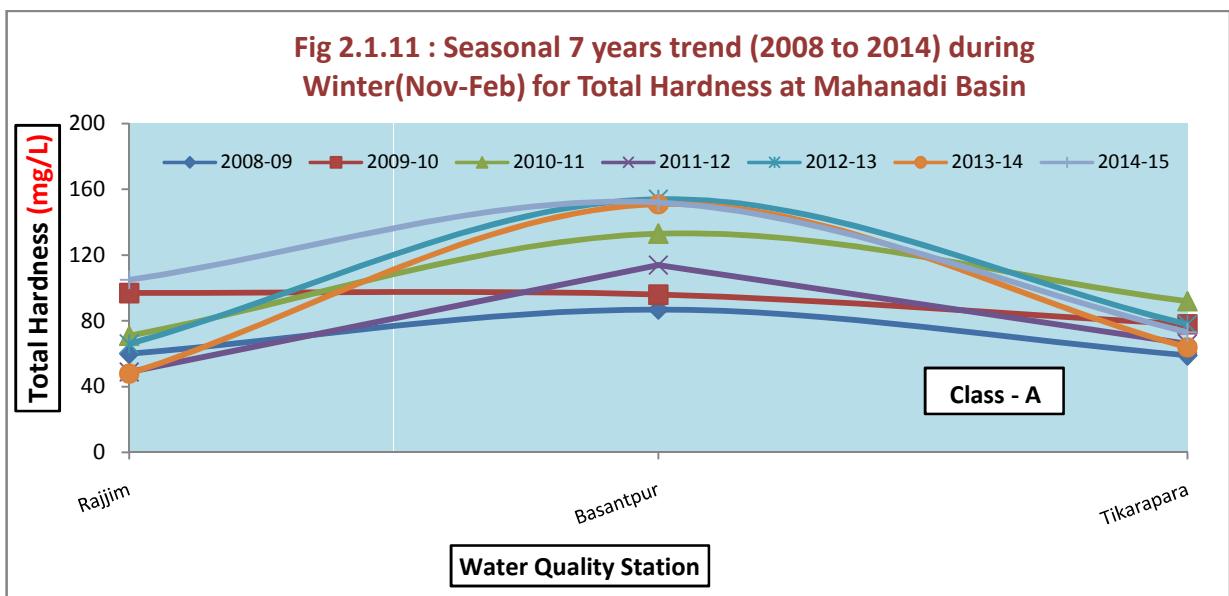

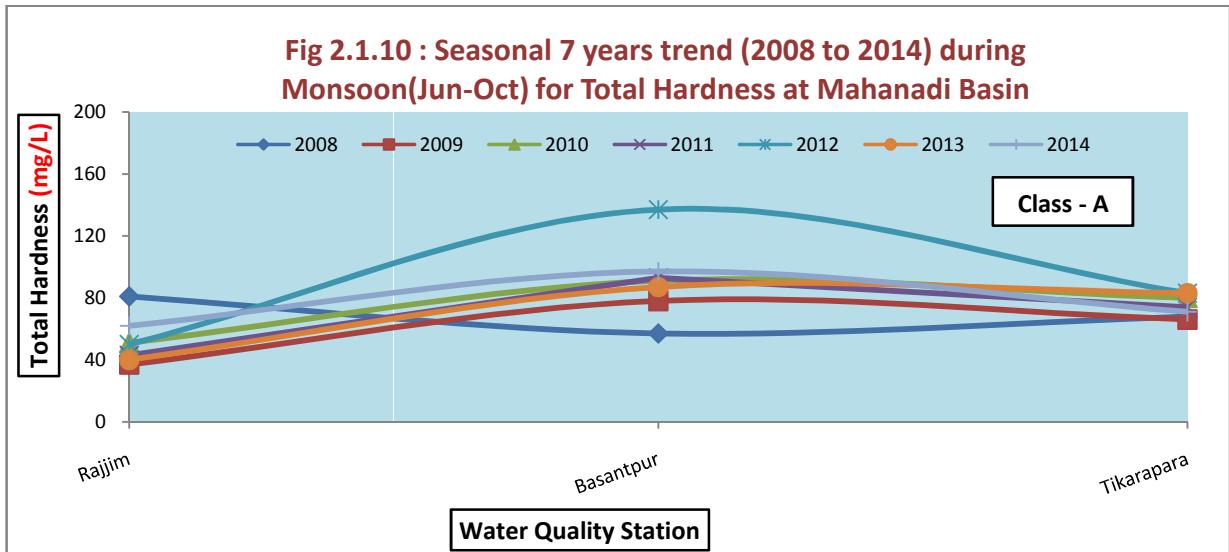

Basin: Mahanadi (Water Quality Parameter : Biological Oxygen Demand)

Basin: Mahanadi (Water Quality Parameter : Dissolved Oxygen)

Basin: Mahanadi (Water Quality Parameter : Total Hardness)

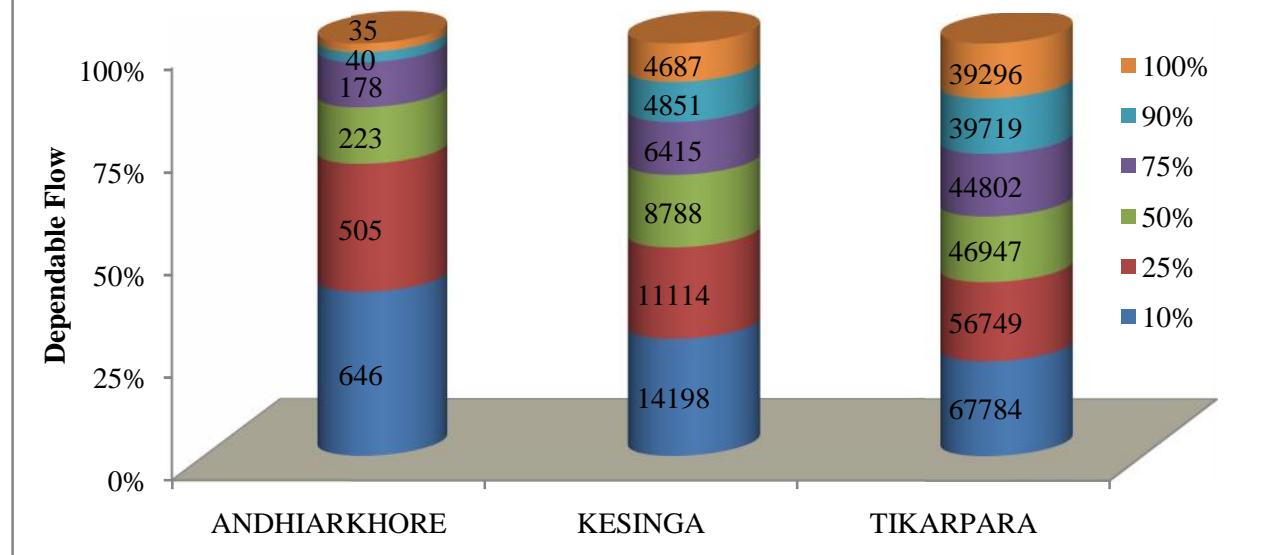

2.1.5 Availability of required amount of water is of paramount importance for any plan or project in water sector for irrigation etc. With this view Table 7 has been presented. It provides dependable flow of water at 10 equal percentile levels for each site. The percentiles have been calculated taking into consideration the last 10 years period (2005 to 2015) of releases of water from the sites. The following pages will graphically reveal the annual dependable flow (10%, 25%, 50%, 75%, 90%, 100%) for the three terminal sites of Non-classified river basins.

Table 2.1.1: Annual Dependable Flow Of Water at Terminal Sites Of Mahanadi Basin

Sl. No.	Site Name	Period	Dependable Flow (Unit: MCM)					
			10%	25%	50%	75%	90%	100%
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1	ANDHIARKHORE	6/2005 to 5/2015	646.30	504.80	222.72	177.69	39.72	34.50

Fig 2.1.13: Annual Dependable Flow of water at terminal sites of Mahanadi River Basin (Ref Period : 2005-2015)

2.1.6 Land Use Statistics: Land use pattern is a fairly useful indicator in understanding the environmental set up, infrastructural facilities and climatic conditions of an area. The land use pattern is an outcome of the interaction and interplay of the various physical conditions of the area. It gives not only the land coverage but also an insight into the nature of environmental degradation in the catchment area of the basins. Hence it is considered very important in the environmental study of any area. Various Government Departments for their respective administrative units such as Blocks/Tehsils/Districts mostly compile the information. But information is not available for districts/areas under different basins. In this issue land use statistics have confined to analysis of information at state and basin-wise. The basin wise land utilisation has been computed as sum total of land use for different classifications in the area of district in a particular state falling within a basin. The data on district and state-wise land use pattern as published by the Directorate of Economics and Statistics, Department of Agriculture & Co-operation, Ministry of Agriculture has been used for the purpose. The data has been classified into (i) forest area (ii) area not available for cultivation (iii) other uncultivated lands excluding fallow land (iv) fallow land (v) net area sown (vi) area sown more than once and (vii) total cropped area.

The land utilisation pattern by district of each basin is presented in Table 14 for the river basins (Region-III). These basins cover approximately 1138 thousand sq. kilometers area of the states as reported land utilized area.

The land use classification reported during 2014-15 as per Ministry of Agriculture for the State is adopted for the catchment area of seventeen river basins (Region-III). The district-wise area under catchment of the basin is reported by India-WRIS and land use under forest coverage, not available for cultivation, other uncultivated land, fallow land and net area shown under the river basin have been indicated under land use statistics. Gross Area Irrigated and net area irrigated within the river basins by source such as canals, tanks, wells and other sources are presented in table 15. The Table 2.1.2 to Table 2.1.4 given below present an overall picture of the basins combined land use pattern, gross and net area irrigated by different sources like Canals, Tanks, Wells, etc.

TABLE 2.1.2: LAND UTILISATION PATTERN OF MAHANADI AND ALL RIVER BASIN (REGION-III) DURING 2014-15 (AREA IN SQ. KM.)

Basin Name	Reporting Area For Land Utilisation	Classification of Reporting Area					Area Sown more than once	Total Cropped Area
		Forest	Not available for Cultivation	Other uncultivated Lands Excluding Fallow Lands	Fallow Lands	Net Area Sown

Source : Consolidated data of river basins from the district level data of India-WRIS and Dte. of Economics & Statistics, M/o. Agriculture

2.1.7 Urban Centres: Three important urban centres in the basin are Raipur, Durg and Cuttack.

2.1.8 Industries: Mahanadi, because of its rich mineral reserve and adequate power resource, has a favorable industrial climate. The important industries presently existing in the basin are iron and steel plant, aluminum factories, paper mill, sand and cement industries.

2.1.9 Minerals: The important minerals found in the basin are Iron Ores, Coal, Lime stone, Quartzite, Copper Ores, Silver, Lead, Mica, Bauxite, Galena and Graphite.

2.2 SUBERNAREKHA BASIN

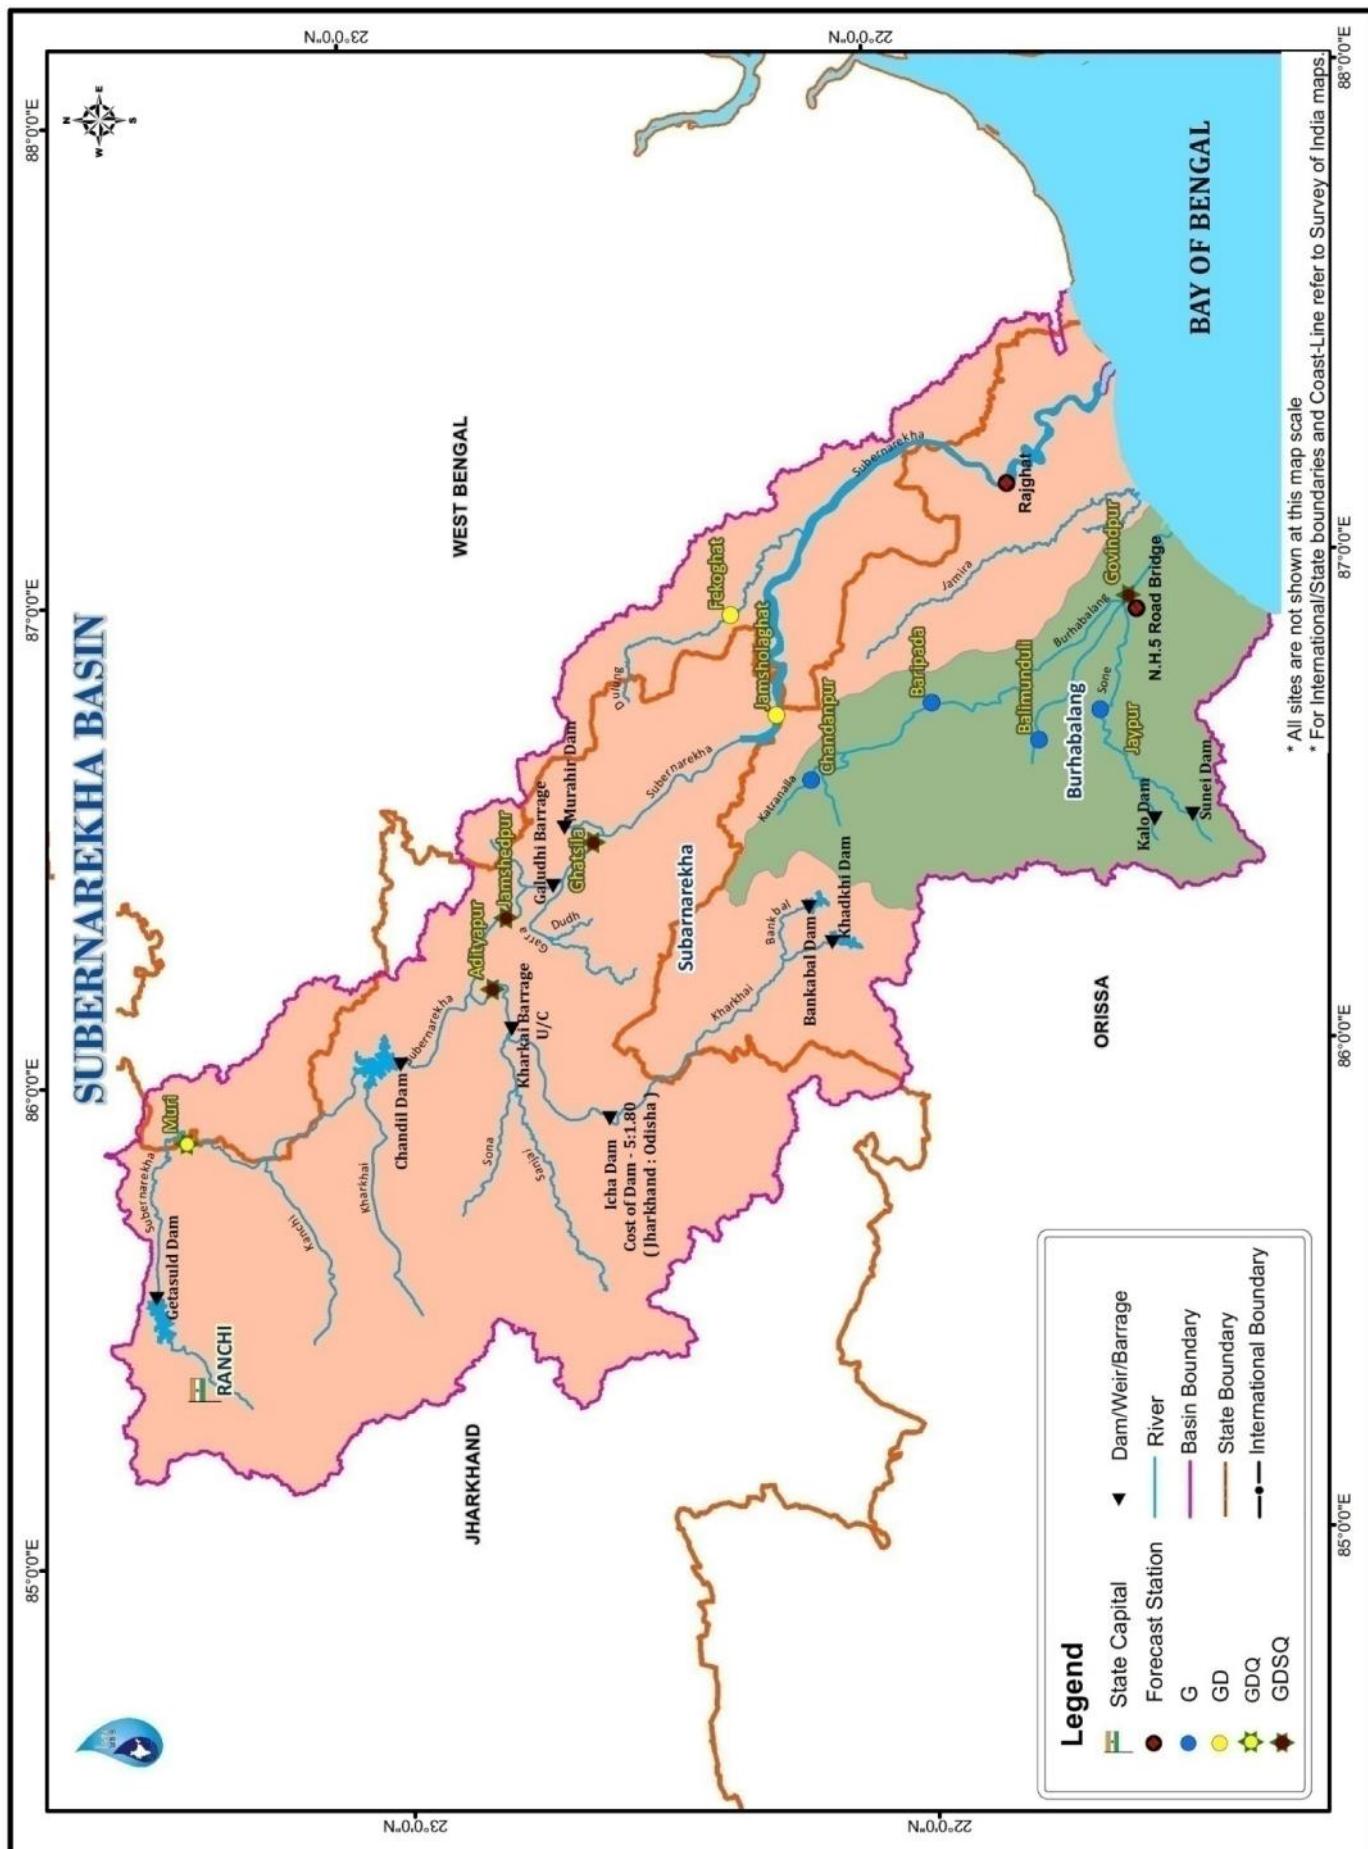

Location: The Subernarekha is one of the longest east flowing inter-state rivers. It covers large areas of Jharkhand and some parts of Odisha and West Bengal. The basin lies between north latitudes of $21^{\circ}15'$ to $23^{\circ}34'$ and east longitudes of $85^{\circ}8'$ to $87^{\circ}32'$ situated in the northeast corner of the peninsular India. It is bounded on the north-west by the Chhotanagpur Plateau, on the south by Baitarani basin and in the south-east by the Bay of Bengal. This river originates near Nagri village in Ranchi district of Jharkhand at an elevation of 600 metre. The total length of the river is about 395 km. Its tributaries are Kanchi, Kharkai, Karkari, Raru, Garru and Dulang. The basin is generally influenced by South-West monsoon, which begins in the month of June and extends upto October.

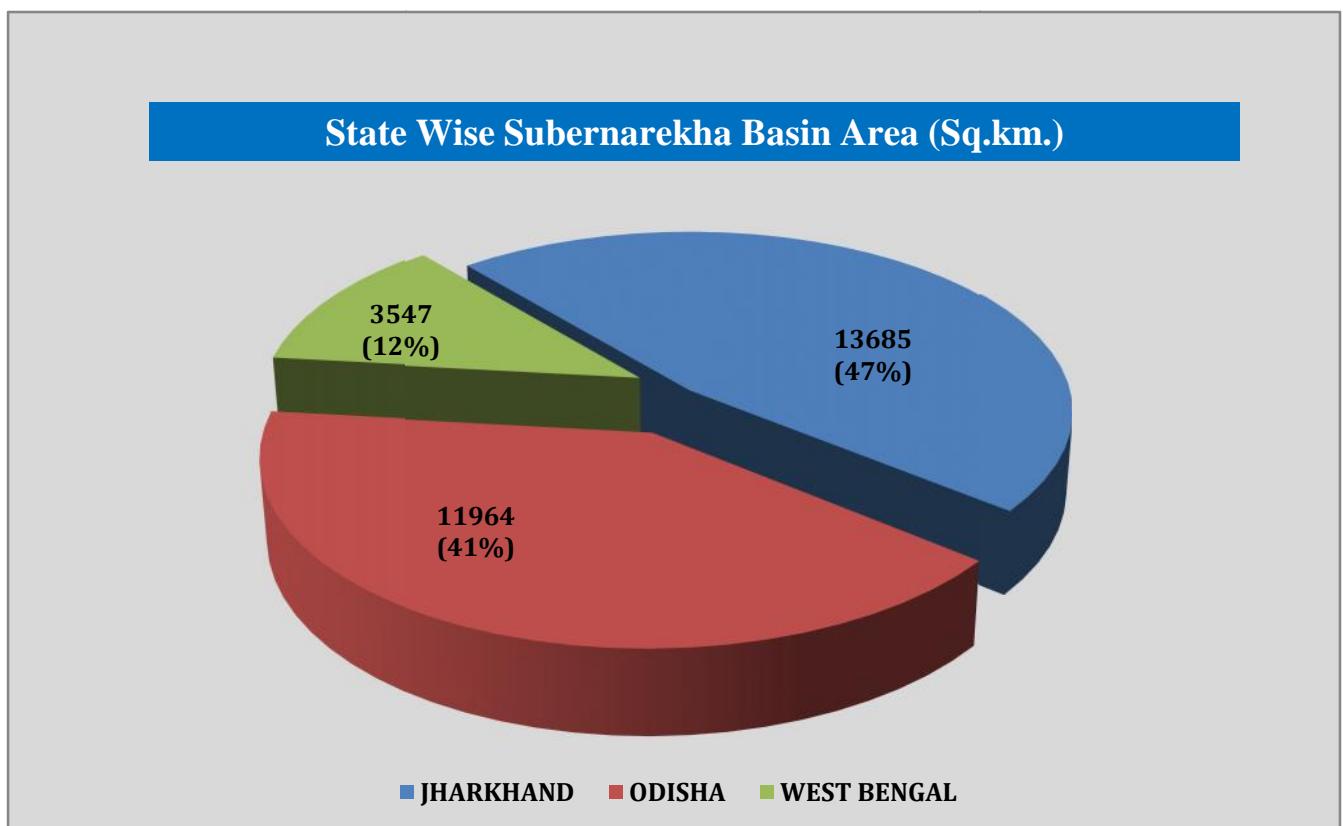

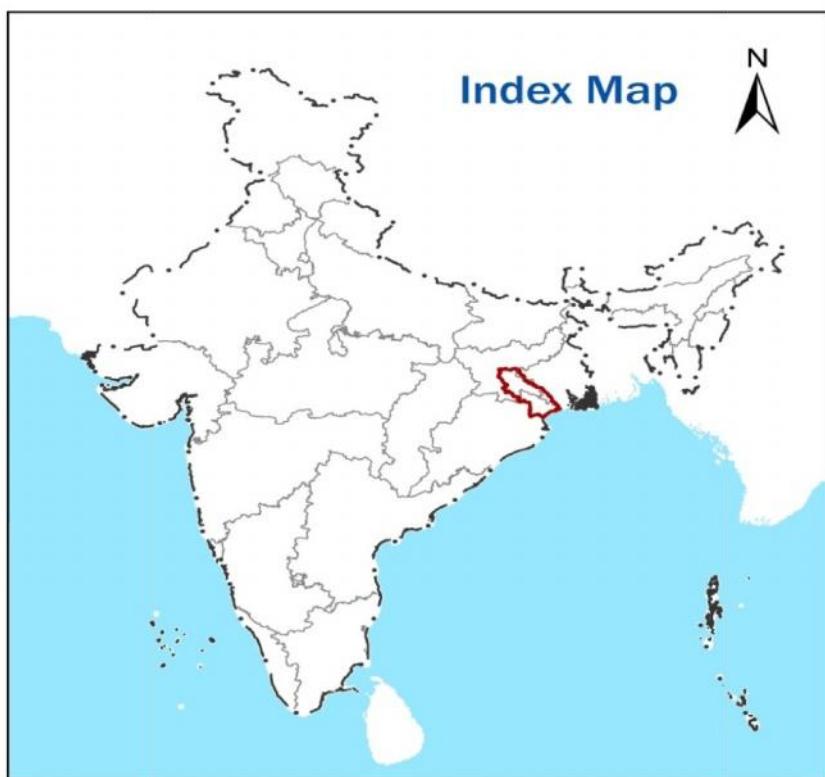

2.2.1 Irrigation Projects: Kanchi irrigation schemes (major), Sunei irrigation project (major), Khadkhi Irrigation Project (medium) are the prominent projects in the basin.

2.2.2 Hydrological Observation (H.O.) Sites: There are 12 H.O. sites out of which at 4 sites (at Ghatsila, Govindpur, Jamshedpur and Adityapur) the data on gauge, discharge, sediment and water quality obseravations are collected. In one site, at Muri, data collected pertains to observations on gauge, discharge and water quality. At site Fekoghat and jamsholaghat, data are collected for gauge, discharge. Besides these sites, there are five sites where only Gauge related data are collected (as per 2014-15 data).

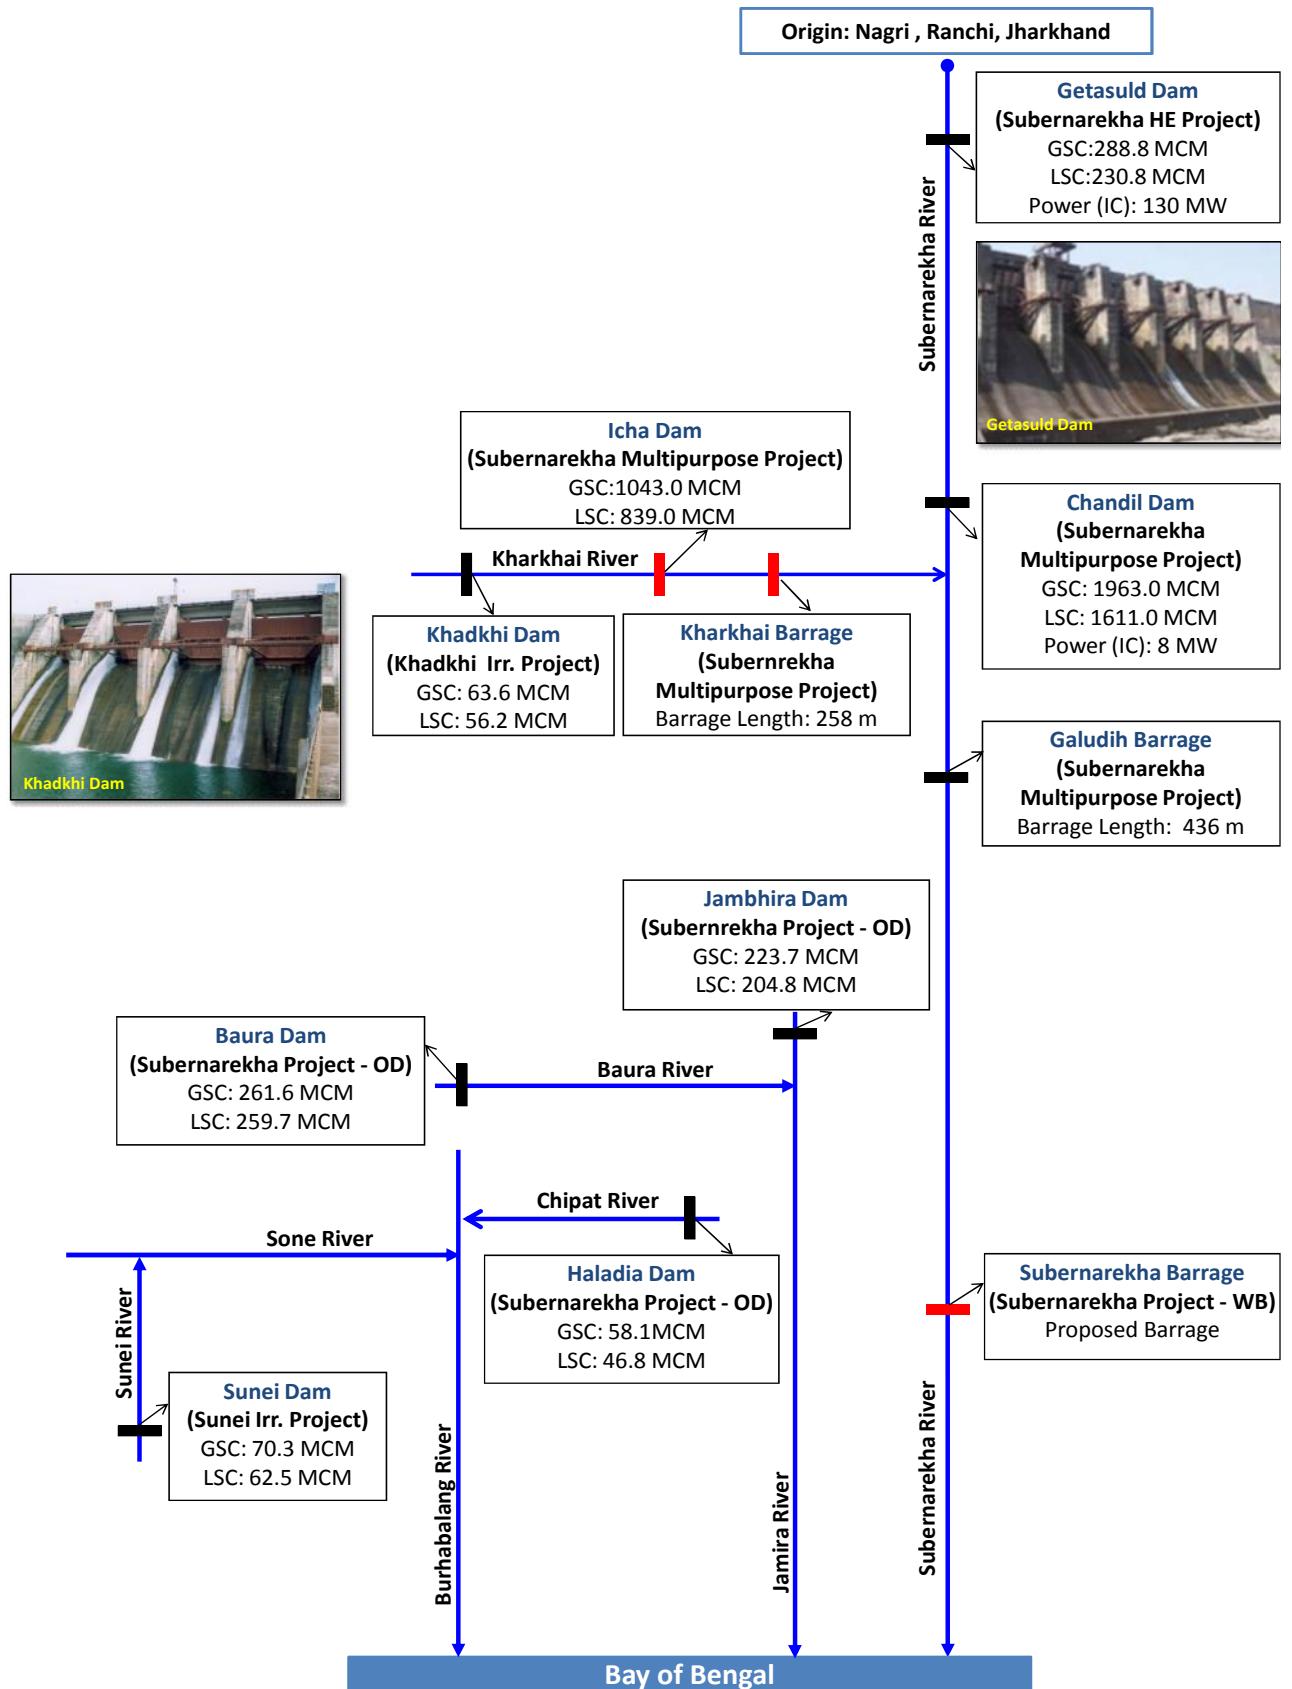

2.2.3 Peak Water Level: This basin contains the information in respect of 7 sites and there is a vast variation in peak water level which varies from 237.50 metre to 8.90 metre during the reference period 2014-15 (See Table 4).

2.2.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for three sites of Subernarekha basin (Fig 2.2.1 to Fig 2.2.12).

2.2.6 Urban Centres: The important cities/ towns in the basin are Jamshedpur and Muri.

2.2.7 Industries: Important industries in the basin are tobacco products, cement, asbestos sheets, glass, ceramics, Locomotives & Coaches, automobiles, agricultural equipment, wires & cables, iron & steel machinery, metal tubes & conduits, copper & brass, chemicals acids & caustics, fertilizers and Soaps.

2.2.8 Minerals: The important minerals found in the basin are Coal, Iron Ores, Bauxite, Copper, Chromium Gold, Vanadium Lime stone, Dolomite, Asbestos, China Clay, Talc and building Stone.

2.3 BRAHMANI AND BAITARANI BASIN

Location: The basin consisting of Brahmani and Baitarani is situated within the geographical co-ordinates of north latitude $20^{\circ}28'$ to $23^{\circ}38'$ and east longitude $83^{\circ}55'$ to $87^{\circ}3'$. This basin is bounded on the north by the Chhotanagpur plateau, on the south-west by Mahanadi basin and on the east by the Bay of Bengal. The basin flows through Jharkhand, Chattisgarh, and Odisha States and its catchment area is 51,822 sq km which is nearly 1.7% of the total geographical area of the country.

2.3.1 *Brahmani Basin*

The Brahmani is known as the South Koel in the upper reaches. It originates near Nagri village in Ranchi District at an elevation of about 600 metre. The total length of its run is about 799 km. The Brahmani sub basin covers 39,033 sq. km and has a long sausage shape. The principal tributaries of this river are Sankh, Tikra and Karo. The climate of the basin is tropical with a fairly hot summer and moderately cold winter. The basin is influenced by south west monsoon from June to October.

2.3.1.1 Irrigation Projects: Rengali (major) and Ramiala irrigation project (medium) are the prominent projects in the catchment area of the basin.

2.3.1.2 Hydrological Observation Sites: There are total 9 H.O. sites out of which two sites are exclusively for guage data only. Gauge, Discharge, Sedimentation and Water Quality observation are being conducted at five sites and one site is maintained for recording observation on gauge and quality and one site is for gauge and discharge (as per 2014-15 data).

2.3.2 *Baitarni Basin*

The Baitarani is one of the important east flowing rivers of peninsular India, flowing eastward and joining the Bay of Bengal. The river originates in the hill ranges of Keonjhar District of Odisha near Dumuria village at an elevation of about 900 metre. The river flows through Jharkhand and Odisha states. The main tributaries of Baitarani are the Salandi and the Matai. The total catchment area of this basin is 12,789 sq km and is roughly circular in shape. More than 93% of the catchment area falls in Odisha. The basin is surrounded by the Brahmani on the south and west, the Subernarekha on the north, the Burhabalang and the Bay of Bengal on the east. The river is flashy in nature; having a total length of 355 km with the upper reach up to Anandpur is in the hilly region. There is a considerable fall in elevation from RL 367m at Champua to RL 28m at Anandpur. The basin receives most of the rainfall from the south-west monsoons during the period from June to October and average rainfall is 1450 mm.

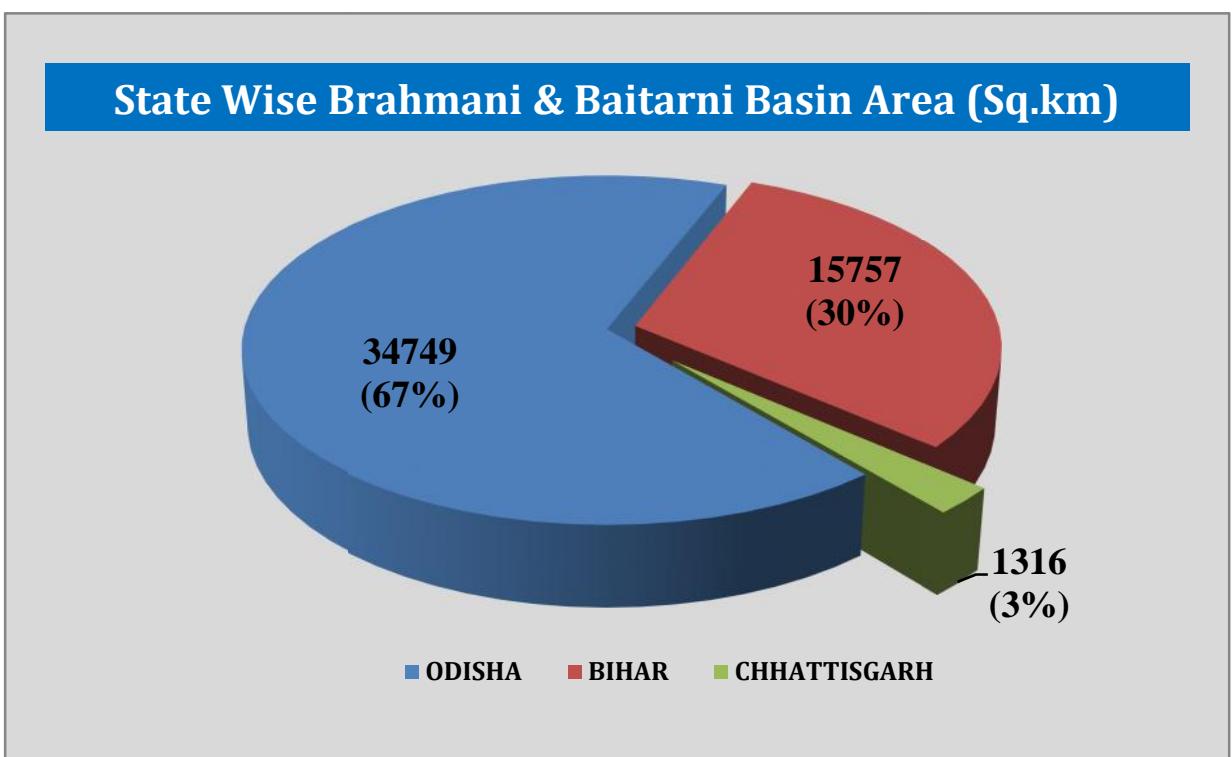

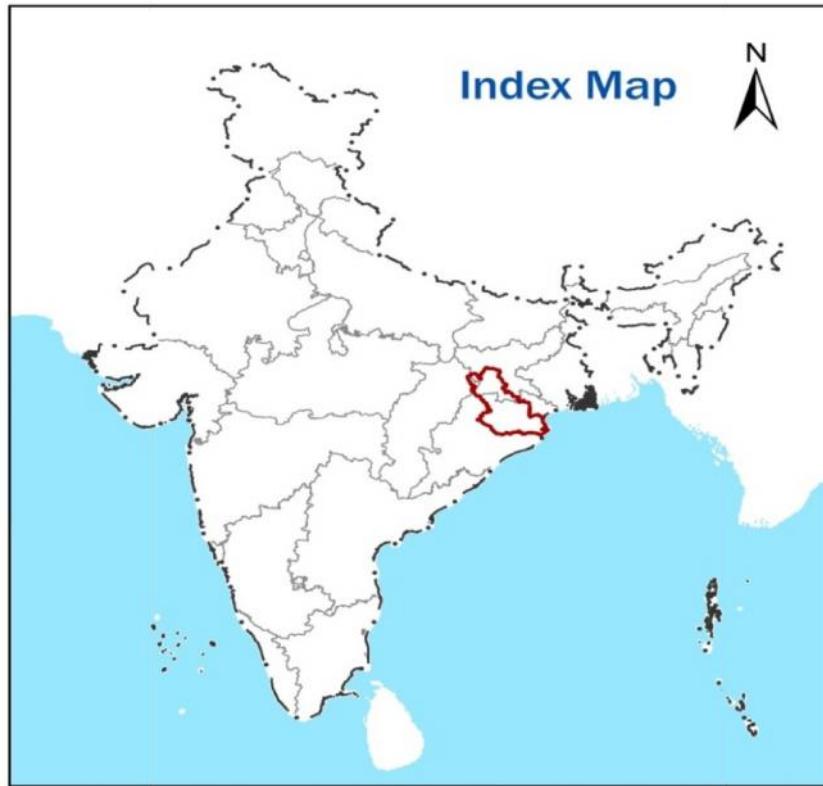

2.3.2.1 Irrigation Projects: Akhuapada, Salandi, Anandpur Barrage and Kanpur Irrigation System are the Major Irrigation Projects in the catchment area of the Baitarni river basin.

2.3.2.2 Hydrological Observation Sites: Central Water Commission is maintaining 6 sites (including seasonal rainfall site at Thakurmunda which remains operative only during monsoon), out of which 2 are of GDSQ (Gauge, Discharge, Sediment, Quality) type, 3 are of G (Gauge) type and 1 is RF (Rainfall) type (as per 2014-15 data).

2.3.3 Peak Water Level: In the Brahmani & Baitarni basin, 8 observation sites have been reported and Anandpur is the oldest site established on 07.03.1972. Gauge/Discharge observations are being recorded since then. Maximum Peak water recorded at 378.95 metre in Champua site on 23.09.2011 during the reference period 2014-15.

2.3.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for four sites of Brahmani & Baitarni basin (Fig 2.3.1 to Fig 2.3.12).

2.3.6 Urban Centres: The important towns in the basin are Champua, Karanjia, Keonjhar, and Anandpur.

2.3.7 Minerals: The important minerals found in the basin are Iron Ore, Copper, Chromite, Asbestos, Manganese, Atomic Minerals, China Clay and Soap Stone.

2.3.8 Industries: Major industries in the basin are Steel Plants and Aluminium plants. There exist a number of other industries like fertilizers, cement, explosives chemicals, machine tools, Ferro-Manganese and sponge Iron Plant.

2.3.9 Minerals: The basin is rich in mineral resources. Coal, Iron ore, Copper, Chromites, Limestone, Dolomites, Bauxite, Manganese, China clay, Fire clay, Asbestos, Atomic Minerals and Soap Stone are the main mineral resources of this basin.

2.4 GODAVARI BASIN

Location: The Godavari River, the largest of the peninsular rivers and third largest in India, covers about 10% of India's total geographical area. The catchment area of the river is 3,12,812 sq km and is spread in the States of Maharashtra (48.6%), erstwhile Andhra Pradesh (23.4%), Madhya Pradesh (10.0%), Chhattisgarh (10.9%), Odisha (5.7%) and Karnataka (1.4%). The basin lies in the Deccan Plateau and is situated between latitude $16^{\circ} 19'$ north and $22^{\circ} 34'$ north and longitude $73^{\circ} 24'$ east and $83^{\circ} 4'$ east. The Godavari river rises in the Nasik district of Maharashtra, about 80 km from the Arabian sea at an elevation of 1,067 metre after flowing for about 1,465 km in a generally south-east direction, through Maharashtra and erstwhile Andhra Pradesh it falls into the Bay of Bengal. The Godavari basin is bounded by the Satmala Hills, the Ajanta range and the Mahadeo hills on the north, by the Eastern Ghats on the south and the east and by the Western Ghats on the west. The basin is roughly triangular in shape and the main river itself runs practically along the base of the triangle.

The western edge of the basin is an almost unbroken line formed by the Sahyadri range of the Western Ghats, from 600 to 2100 metre height. It has the heaviest rainfall and the dampest climate in the basin.

About 64 km from its source, the Godavari receives the waters from Dharna, on its right bank and the Kadana joins it from the left. The combined waters of the Pravara and Mula which rise in the hills of Akola join the river about 217 km from its source, About 338 km lower down, while still in Maharashtra, the river receives the combined waters from the Purna and Dudhna rivers and after a further 138 km at the border of Maharashtra and erstwhile Andhra Pradesh, the waters of the Majira river joins it from the south. At this point, Godavari flows at an elevation of about 329 metre.

The Pranhita river, conveying the combined waters of the Penganga, the Wardha and Wainganga, which drain Nagpur and southern slopes of the Satpura ranges, falls into Godavari about 306 km below its confluence with the Majira. Forty eight km lower, the waters of the Indravathi join the river. Both the Pranhita and the Indravathi are major rivers in their own right. The last major tributary is the Sabari from Odisha, which falls into the Godavari, 100 km above Rajahmundry.

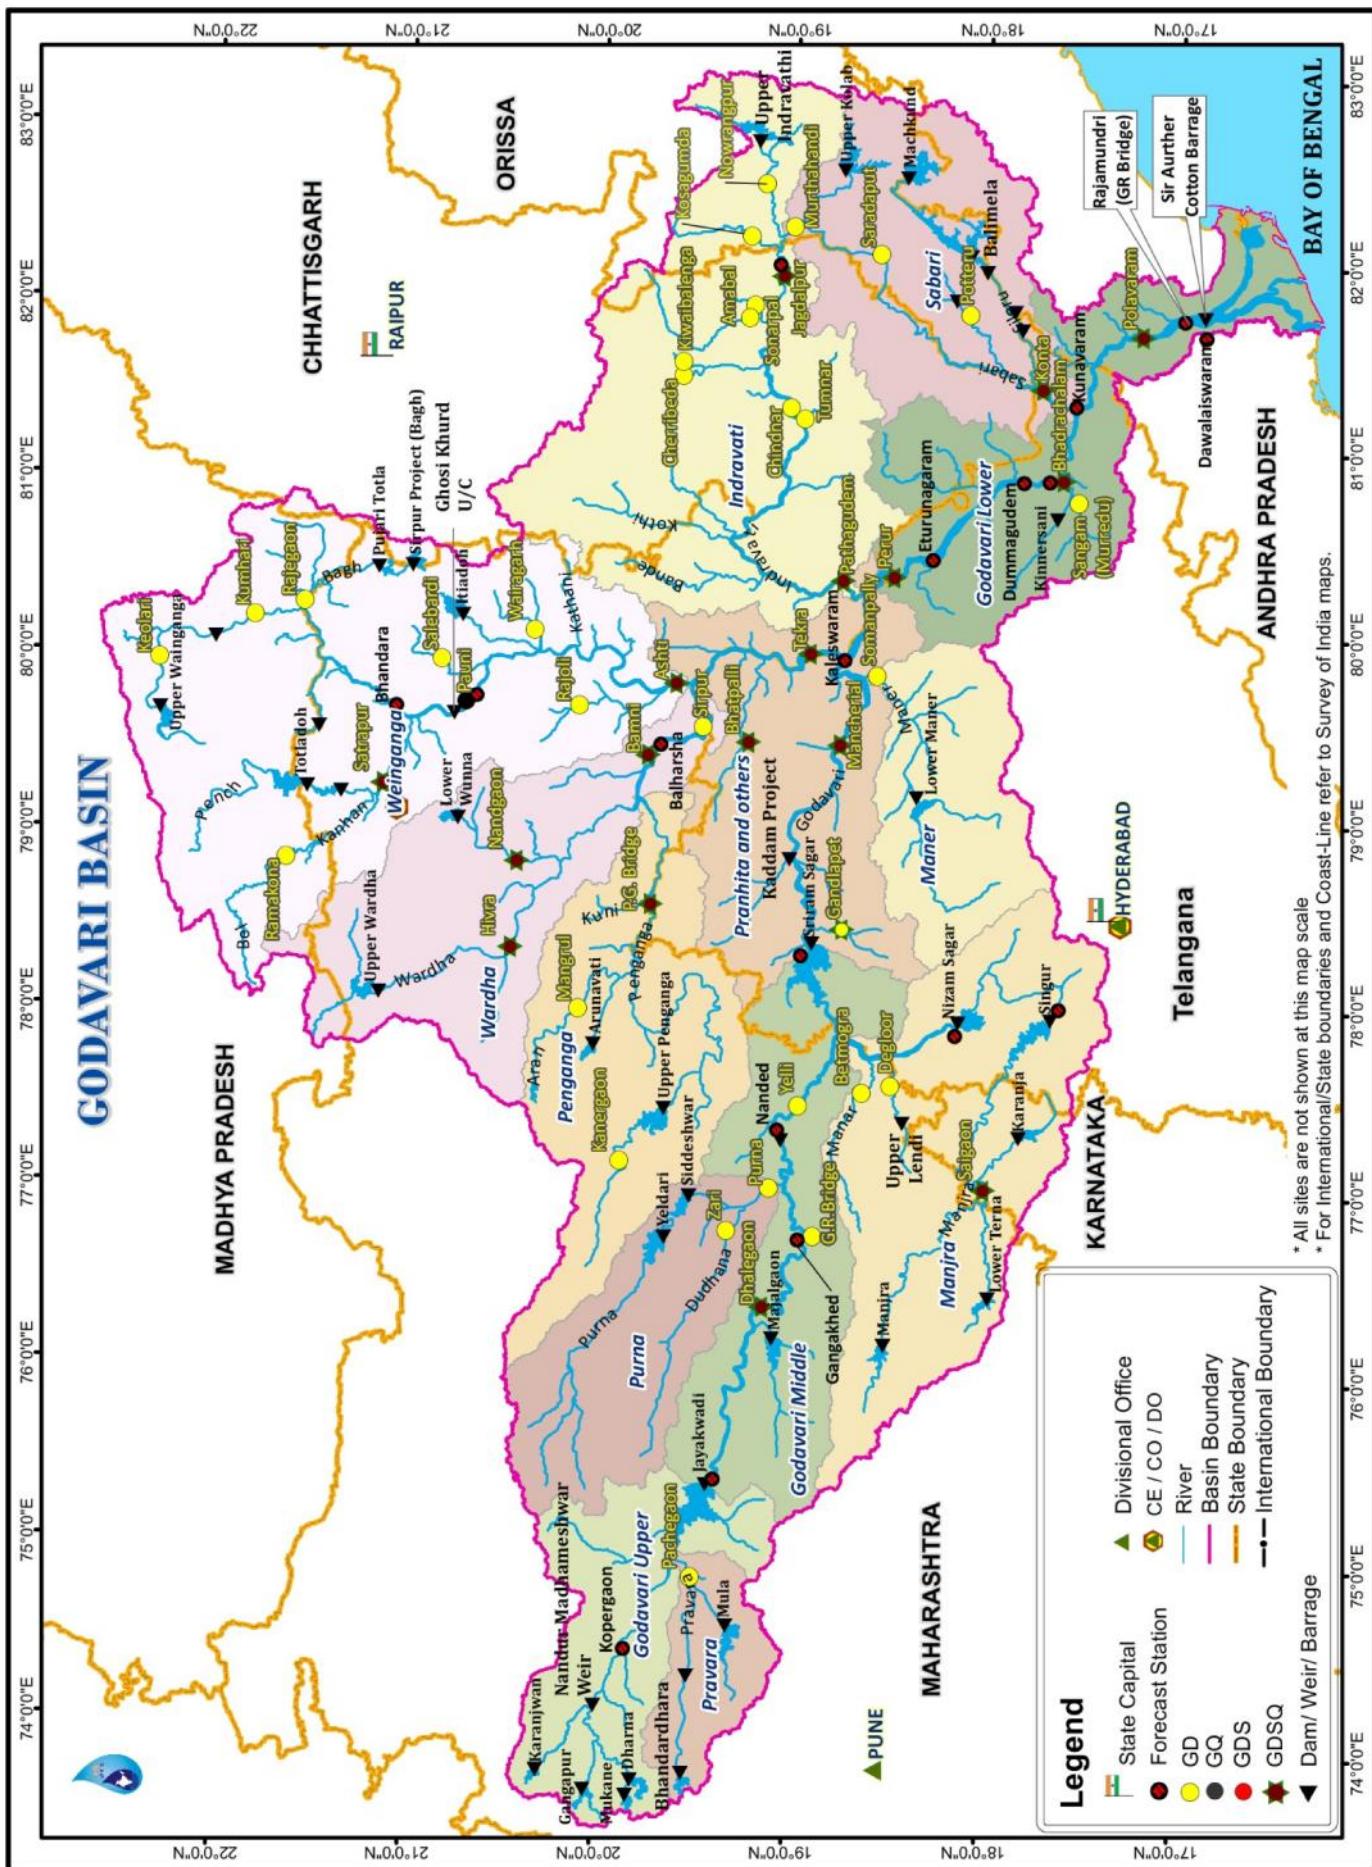

The largest tributary of the Godavari is the Pranhita with about 20% coverage of drainage area. The Pravara, Manjira and Maner are notable right bank tributaries, and the Purna, Pranhita, Indravathi and Sabari are important left bank tributaries. The Godavari in the upper, middle and lower reaches make up for 24.1% coverage of drainage area. The Godavari basin as whole receives 1043 mm of the annual rainfall on an average, during the southwest monsoon, which sets in mid June and ends by mid October.

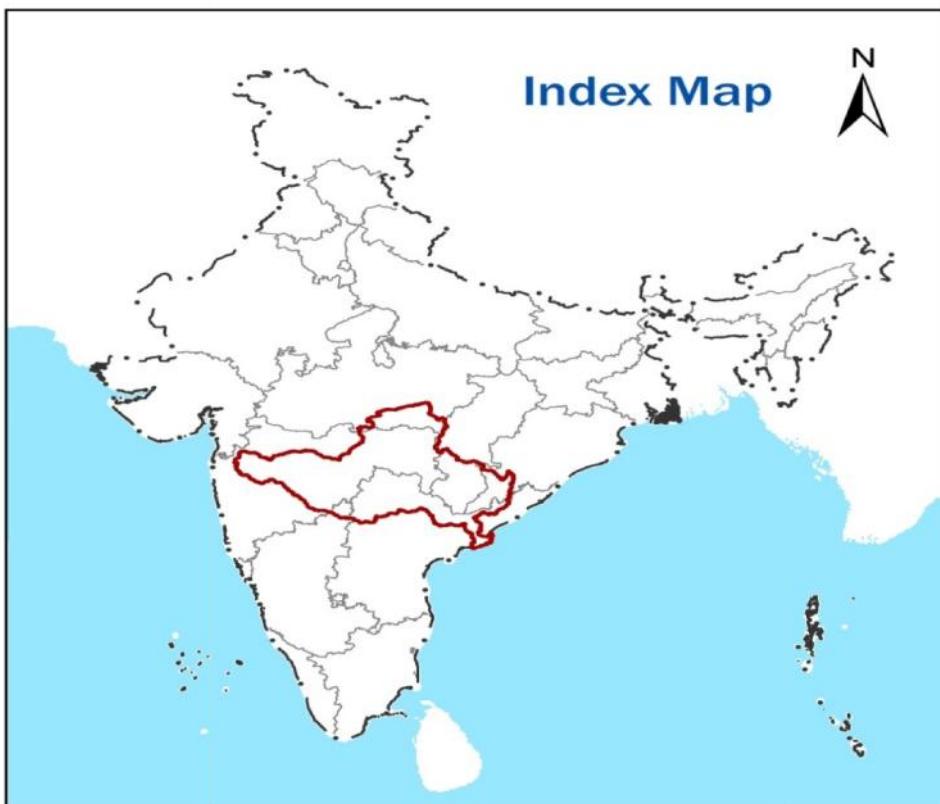

2.4.1 Irrigation Projects: Kadam, Wainganga Canal and Surthi System major Irrigation Projects are in the catchment area of Godavari Basin. The Kodwa, Godavari (Dama), Pravara, Purna, Pus, Gangapur, Bagh, and Mula Major Projects of Maharashtra are in the catchment area of Godavari Basin. There are several prominent Major Irrigation Projects like Waghed, Ozarkhed, Karanjawan, Pallakhed and Madmeswar, Jayakwadi Stage-1, Bhandaradara, Manar, Adhole, SRS Project, Nizamsagar, Lower Maner, Maner Project, Manjira, Dhuti weir, Idiadoh, Cotton Barrage, Lakhnavaram, Upper Kolab and Lower Sileru situated also in the catchment areas of the river basin.

2.4.2 Hydrological Observation Sites: There are in total 30 H.O. sites out of which 30 for Gauge, 30 for Discharge and 10 for water quality (as per 2014-15 data).

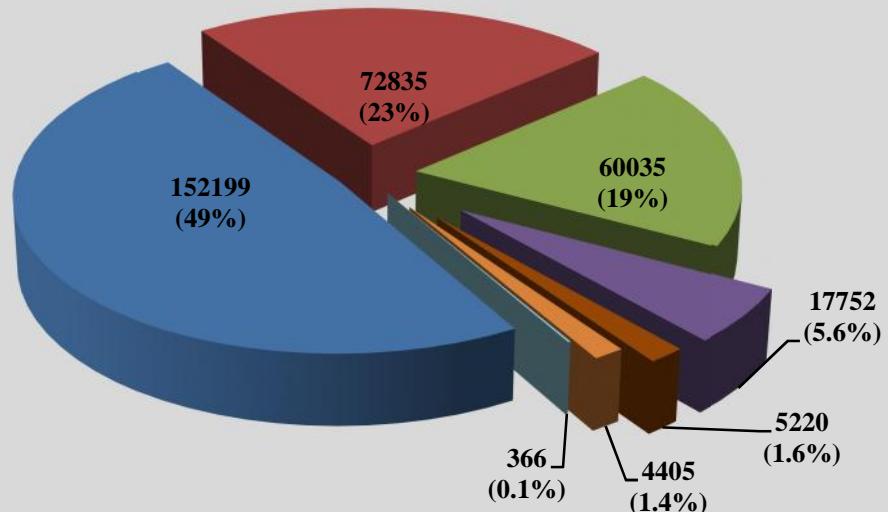

2.4.3 Peak Water Level: This is a large basin in area in respect of drainage area. It has 48 historical sites which are maintaining the information on observations in respect of at least two or more types of data: Gauge/Discharge, Sedimentation and Water Quality. Tekra is the oldest site in the basin and established on 15.07.1964 for collecting data on Gauge/ Discharge, Subsequently, the scope has been extended to observe data on sedimentation and water quality. Among all the reported sites, the maximum water level was observed at Cherribeda (573.90 metre) site on 04.07.2006 during the reference period 2014-15. The Polavaram site reported the minimum peak water level at 28.02 metre on 16.08.1986 for the same the reference period.

2.4.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for three sites of Godavari basin (Fig 2.4.1 to Fig 2.4.12).

2.4.6 Urban Centre: Nagpur is the most important urban centre in the basin. Other important towns are Nashik, Aurangabad, Warangal, Rajahmundry, and Nizamabad.

2.4.7 Industries: A small part of the enormous forest wealth of the basin is at present utilized as timber and in the manufacture of paper and other timber products. Industries based on agricultural produce are the processing of agricultural commodities like rice milling, cotton ginning, processing, spinning and weaving, manufacture of sugar, manufacture of textiles, extraction of oil from groundnut and other oil seeds.

2.4.8 Minerals: The Godavari basin has a rich variety of mineral wealth spread over vast areas. The principal minerals found are bauxite, manganese, iron ore, Corundum and coal. Other minerals like lead, zinc, and corundum are also found in different parts of the basin.

2.5 KRISHNA BASIN

Location: The Krishna basin extends over an area of 2,58,948 Sq km out of which 26.4% is in Maharashtra, 43.8% is in Karnataka and 29.8% falls in erstwhile Andhra Pradesh. The basin lies between east longitudes $73^{\circ} 17'$ to $81^{\circ} 9'$ and north latitudes $13^{\circ} 10'$ to $19^{\circ} 22'$ in the Deccan plateau. The Krishna rises in the Western Ghats at an altitude of 1337 metre just north of Mahabaleshwar, about 64 km from the Arabian Sea and flows from west to east through the States of Maharashtra, Karnataka and erstwhile Andhra Pradesh to join the Bay of Bengal. The total length of the river from the sources to its outfall in the sea is about 1,401 km of which 612 km are in erstwhile Andhra Pradesh, 306 km in Maharashtra and 483 km in Karnataka. Together with its tributaries, the river drains about 708 km of the Western Ghats, which is its chief source of supply. The Ghataprabha, the Malaprabha, the Bhima, the Tungabhadra, Munneru and Musi are the principal tributaries. The Krishna basins' predominant land use is agriculture.

The Krishna basin is bounded in the north by the ridge separating it from the Godavari basin in the south and in east by the Eastern Ghats and in the west by the Western Ghats. The basin is roughly triangular in shape with its base along the Western Ghats, the apex at Vijayawada and the Krishna itself forming the median. All the major tributaries draining the base of the triangle fall into the river in the upper two-thirds of its length.

The Krishna river rises in the western Ghats at an altitude of 1337 metre just north of Mahabaleswar, about 64 km. from the Arabian Sea and flows from west to east through the States of Maharashtra, Karnataka and erstwhile Andhra Pradesh before it joins the Bay of Bengal downstream of Vijayawada.

There are about 13 major tributaries which join river Krishna along its 1400 km. course, out of which six are right bank tributaries and seven are left bank tributaries. Among the major tributaries, the Ghataprabha, the Malaprabha and the Tunga Bhadra are the principal right bank tributaries which together account for 35.45% of the total catchment whereas the Bhima, the Musi and the Munneru are the principal left bank tributaries which together account for 35.62% of the total catchment area.

The average annual rainfall in the Krishna basin is 784 mm. The South West Monsoon sets in by middle of June and withdraws by the middle of October. About 90% of annual rainfall is received during the Monsoon months, of which more than 70% occurs during July, August and September.

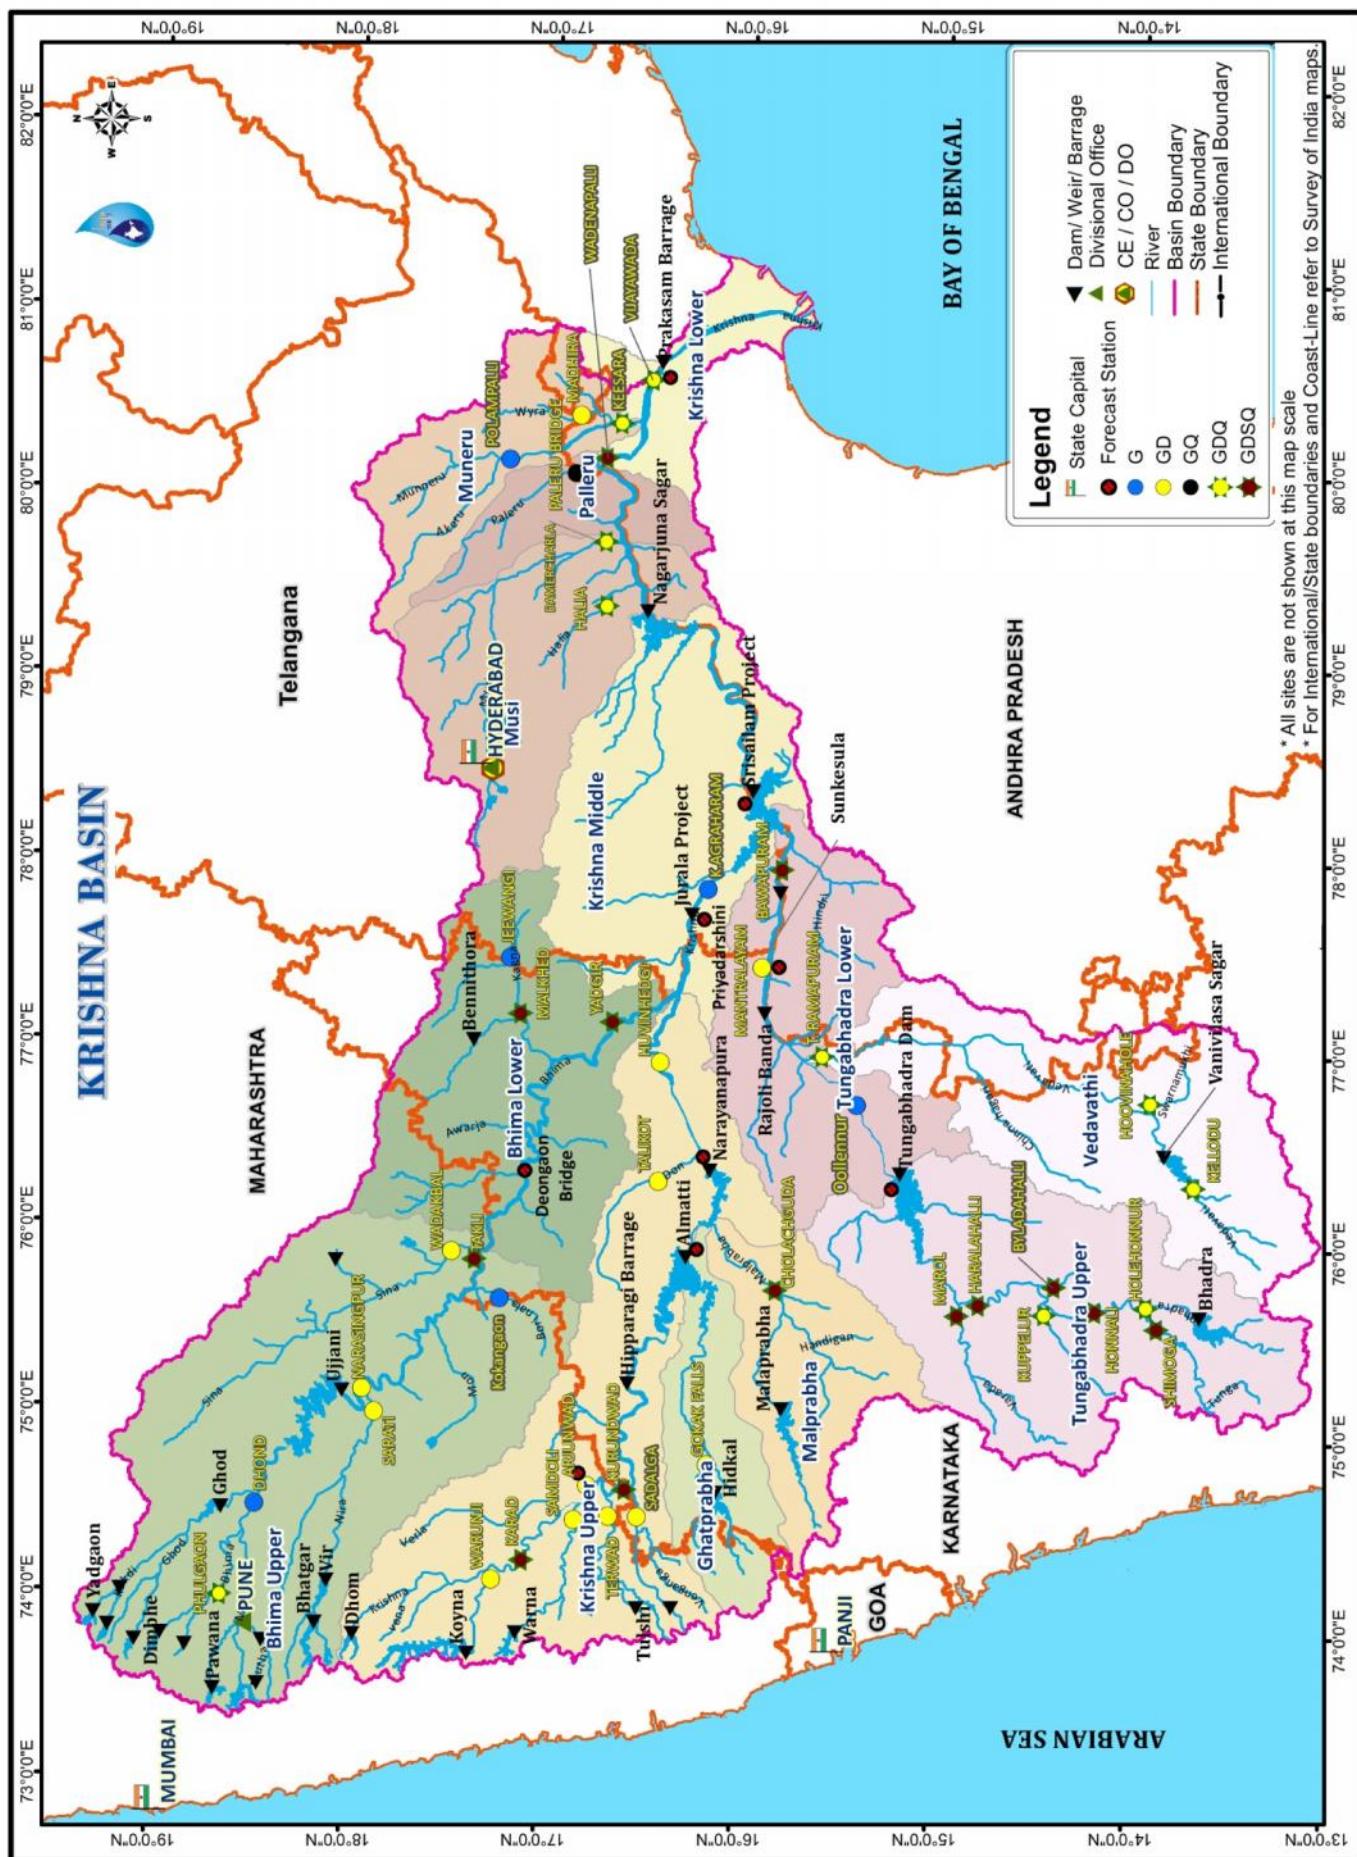

Though few major projects like Krishna delta were in existence prior to independence, planned development of water resources of Krishna basin took place after independence. The completed important major projects in Krishna basin are Koyna and Ujjani projects in Maharashtra state.

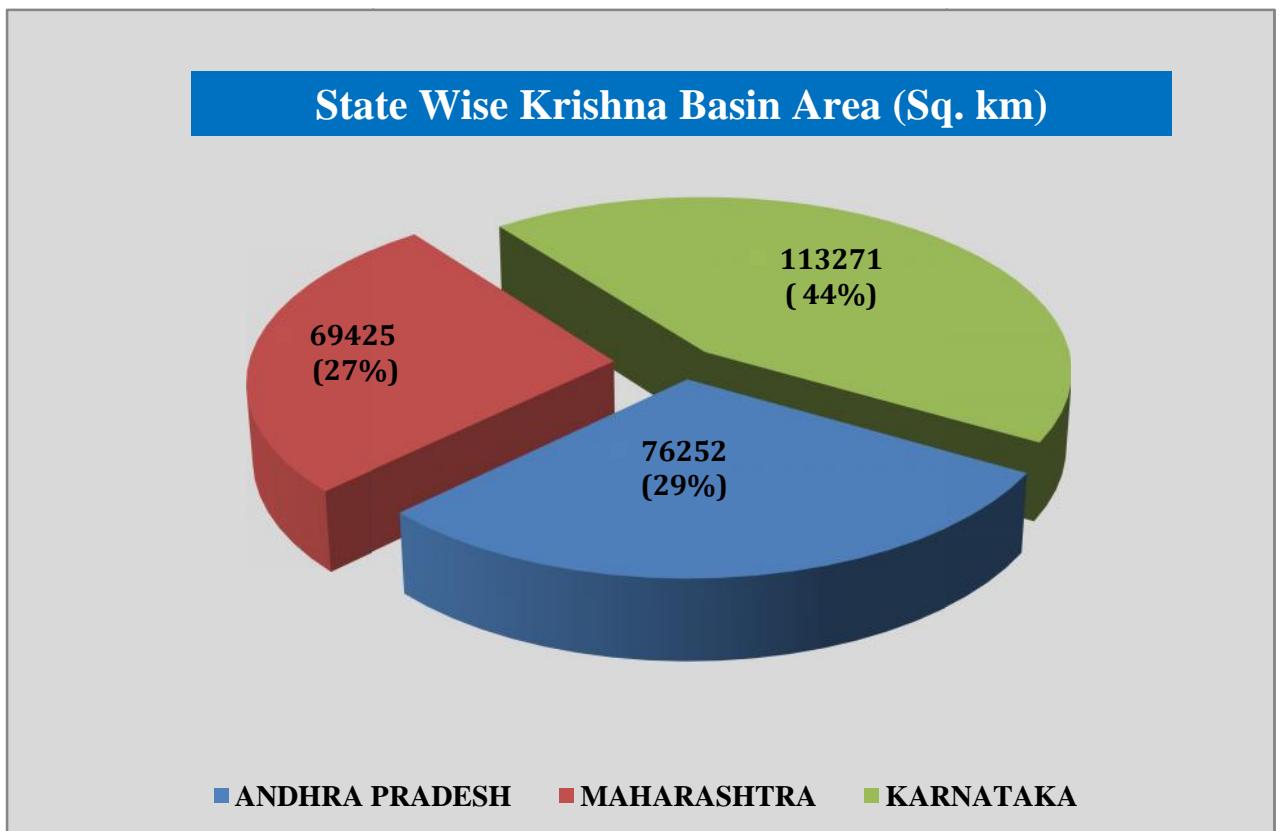

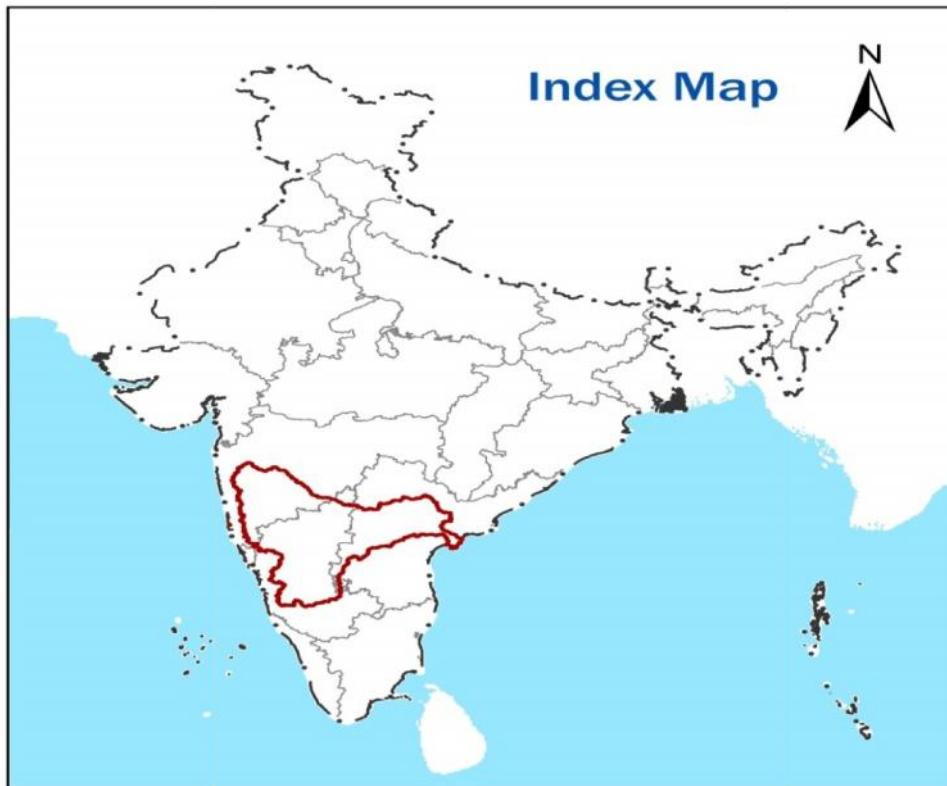

2.5.1 Irrigation projects: Radhanagari, Ghod, Almatti Dam, Khadakwasla, Vir Dam, Koyna, Tungabhadra, Bhadra, Musi Project, Nagarjuna Sagar, Srisailam, P.D.Jurala and Prakasam Barrage are the major projects in the catchment areas of the river basin.

2.5.2 Hydrological Observation Sites: As per 2014-15 data, there are 52 Hydrological observation stations in the basin. Sediment observations are made at 14 of these stations. In addition, gauge (all sites), discharge (36 sites) observations are also made in these stations.

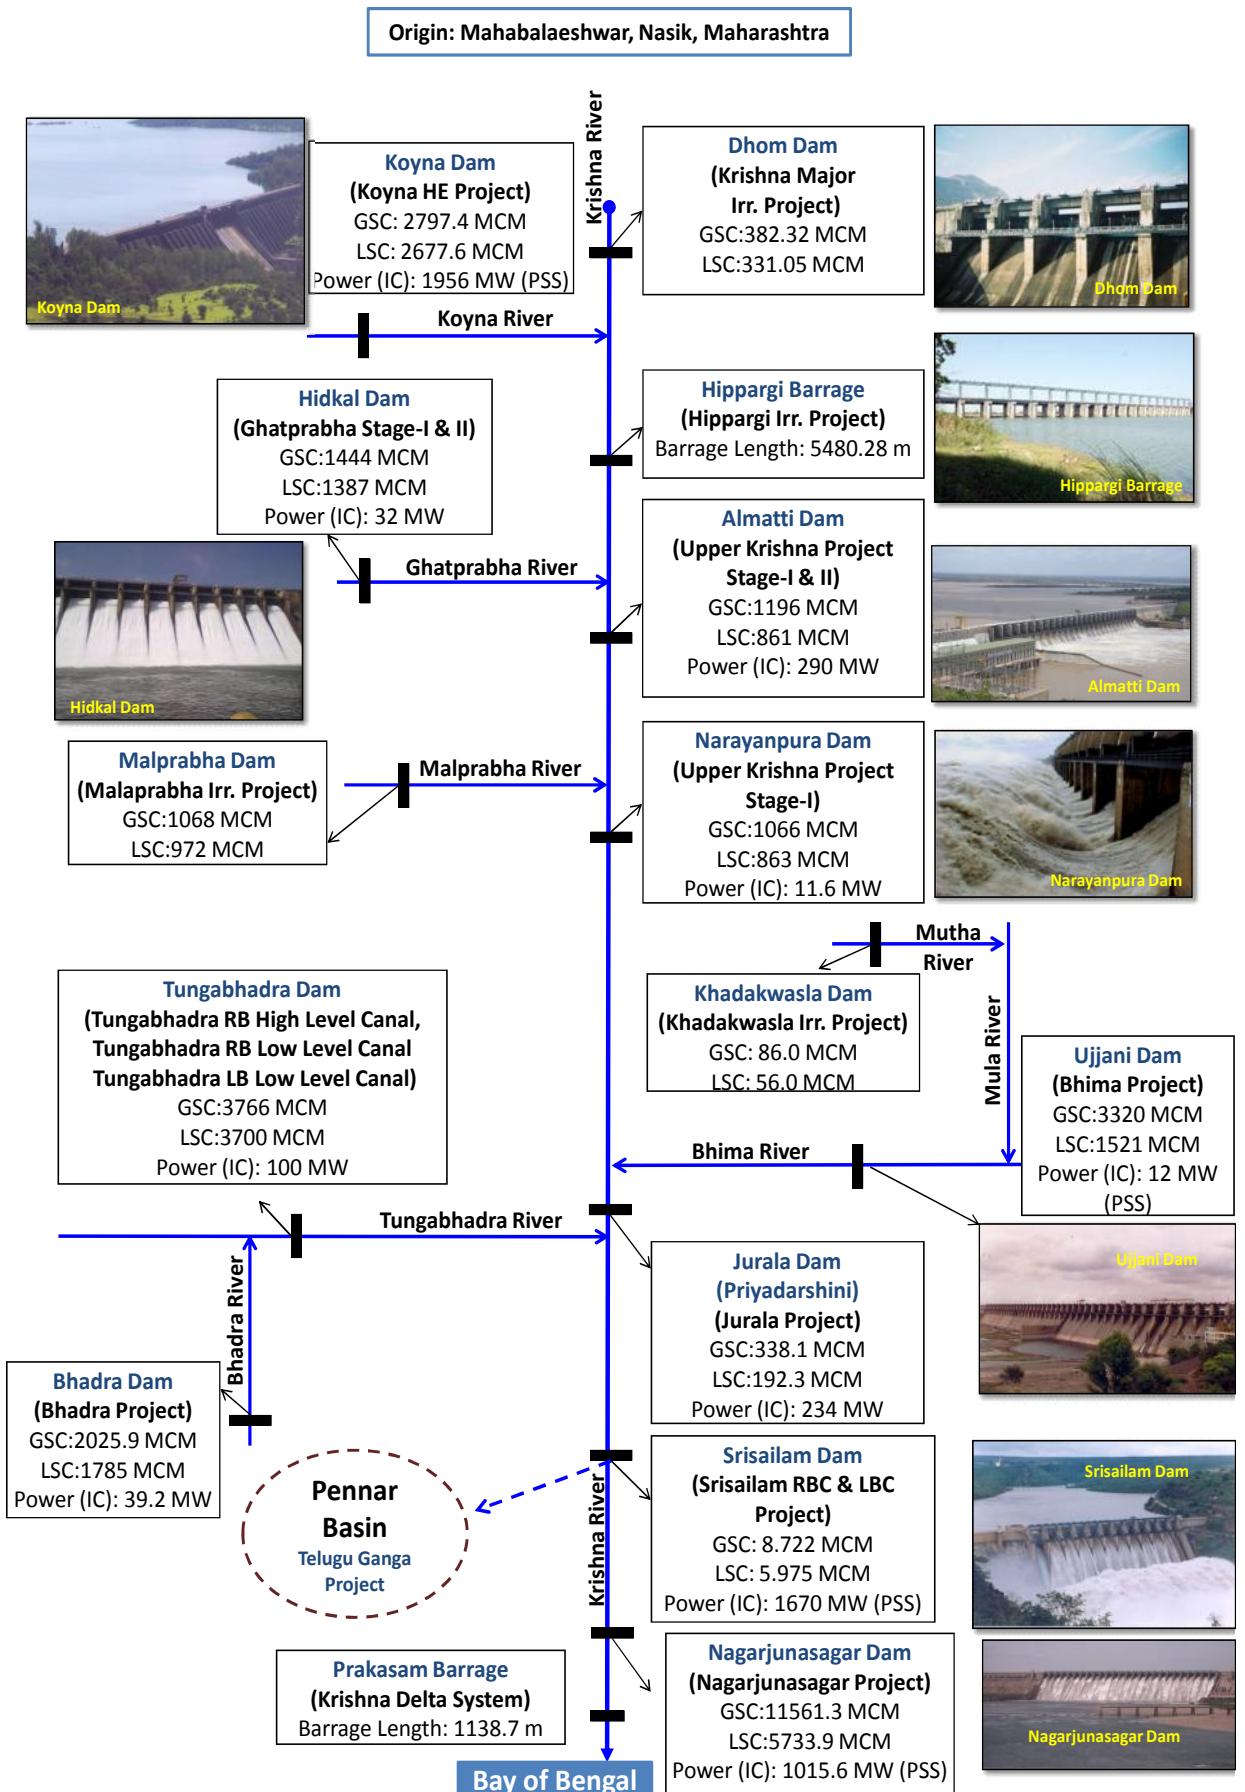

2.5.3 Peak Water Level: It has 38 sites in all for hydrological observations. Among these sites, peak water level varied from 19.27 metre at Vijaywada site (minimum) to 650.25 metre at Kellodu site (maximum) during the reference period 2014-15.

2.5.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for three sites of Krishna basin (Fig 2.5.1 to Fig 2.5.8).

2.5.6 Urban Centres: The major cities in the basin are Pune, Hyderabad & Vjayawada.

2.5.7 Industries: The main industries in the catchment are Textiles, Sugar, Chemical, Cement factories, Automobiles, Engineering goods, Nuclear energy related.

2.5.8 Minerals: The important minerals found in the catchment are gold, bauxite, lime stone, iron ore, manganese ore, quartz, copper, red oxide, soapstone, etc.

2.6 CAUVERY BASIN

Location: The Cauvery river originates at Talakaveri in Coorg District of Karnataka in Brahmagiri Range of hills in the Western Ghats at an elevation of 1,341 metre and drains a total of 81,155 Sq km area of which 34,273 Sq km lies in Karnataka, 43,856 sq km in Tamil Nadu, 2,866 sq km in Kerala and 160 sq km in the Union Territory of Puducherry. The basin lies between east longitudes $75^{\circ} 27'$ to $79^{\circ} 54'$ and north latitudes $10^{\circ} 9'$ to $13^{\circ} 30'$. The Cauvery basin is bounded by Tungabhadra sub-basin of Krishna basin in the northern side and Palar sub-basin in the southern side. The Western Ghats form the western boundary. The Nilgiris, an offshore of Western Ghats, extend eastwards to the Eastern Ghats and divide the basin into two natural and political regions i.e. Karnataka plateau in the north and the Tamil Nadu plateau in the south. In Tamil Nadu, the eastern part of the basin is in the elevation range of 0 to 150 metre sloping gently up from the sea.

At Shivanasamudram, the river branches off into two parts and falls through a height of 91 metre. in a series of falls and rapids. The falls at this point is utilised for power generation. The power station at Shivanasamudram was built as early as 1902. The two branches of the river join after the falls and flows through a wide gorge which is known as "Mekedatu" (Goats leap) and continues its journey and forms the boundary between Karnataka and Tamil Nadu States for a distance of 64 kms. At Hogenekkal Falls, it takes southerly direction and enters the Mettur Reservoir, which was constructed in 1934. A tributary called Bhavani joins Cauvery on the right bank about 45 kms below Mettur Reservoir, thereafter it takes easterly course to enter the plains of Tamil Nadu. Two more tributaries Noyyal and Amaravathi join on the right bank and here the river widens with sandy bed and flows as "Akhanda Cauvery".

Immediately after crossing Tiruchirappalli district, the river divides into two parts, the northern branch being called "The Coleron" and southern branch remains as Cauvery and from here the Cauvery Delta begins. After flowing for about 16 kms, the two branches join again to form "Srirangam Island". On the Cauvery branch lies the "Grand Anicut" said to have been constructed by a Chola King in 2nd Century AD. Below the Grand Anicut, the Cauvery branch splits into two, Cauvery and Vennar. These branches divide and sub-divide into small branches and form a network all over the delta.

The total length of the river from the origin to its outfall into the sea is 800 kms of which 320 kms is in Karnataka, 416 kms in Tamil Nadu and 64 kms forms the common border between the Karnataka and Tamil Nadu states. The Cauvery basin is fan shaped in Karnataka and leaf shaped in Tamil Nadu. The run-off does not drain off quickly because of its shape and therefore no fast rising floods occur in the basin. In the Cauvery basin, four distinct seasons occur viz. (i) Cold weather, (ii) Hot weather, (iii) South West Monsoon and (iv) North-East Monsoon. The basin is mainly influenced by South-West Monsoon in Karnataka & Kerala and North-East Monsoon in Tamil Nadu.

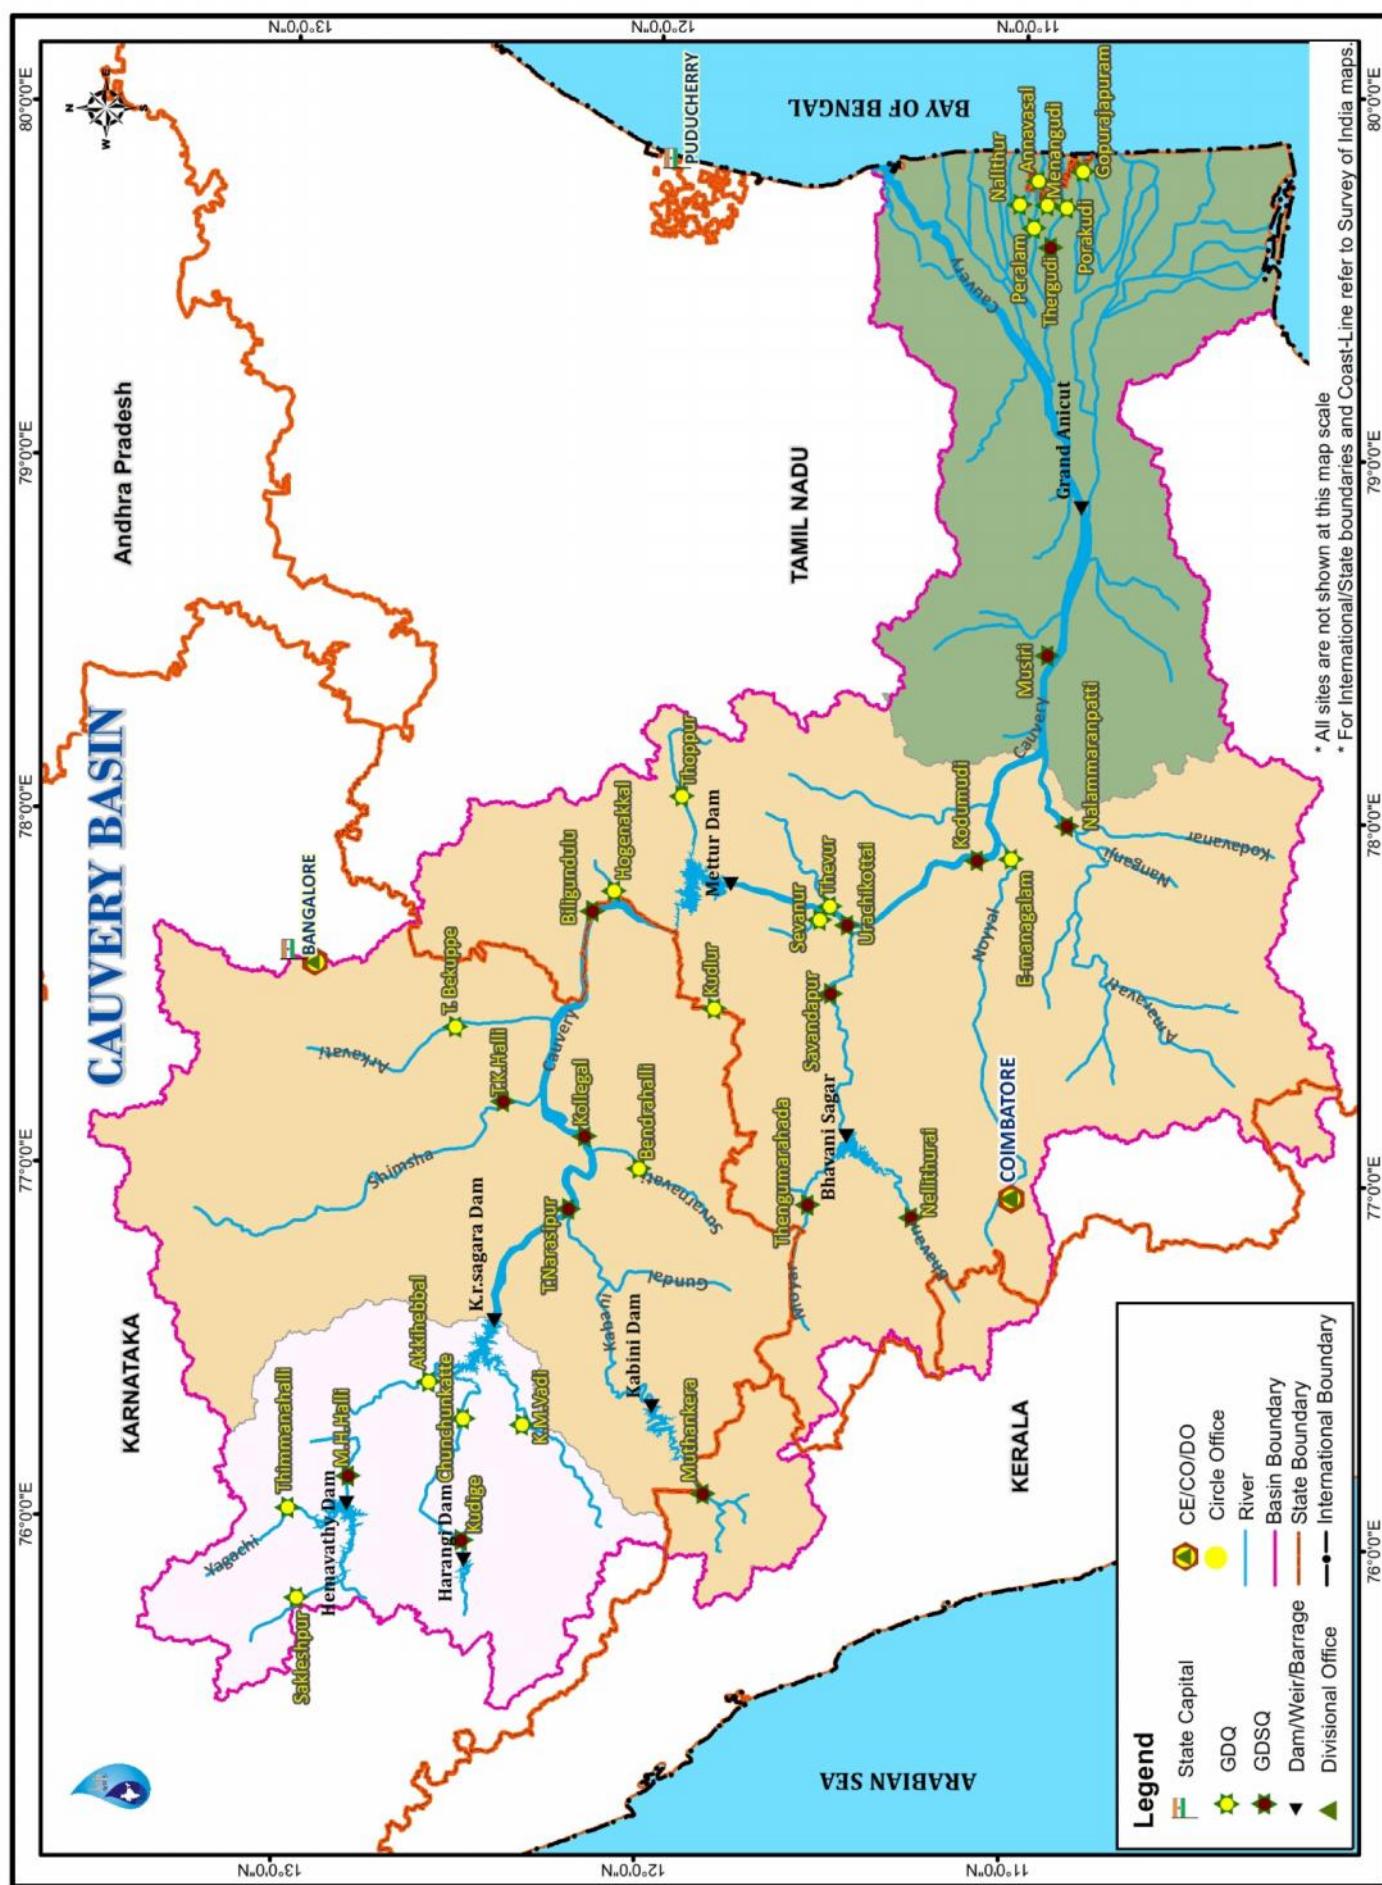

The Cauvery river system consists of 21 principal tributaries each with catchment area exceeding 250 sq km. The largest of all of them are the Catchment Area Shimsha, lying wholly in Karnataka, the Amaravathi rising in Kerala but lying mostly in Tamil Nadu and the Kabini rising in both Kerala and Tamil Nadu but lying mostly in Karnataka. The Bhavani is the fourth largest and the second longest. It rises in Kerala and Karnataka but lies mostly in Tamil Nadu. The longest tributary, the Hemavathi (245 kms) is the fifth largest river in catchment area and lies wholly in Karnataka. From the point of view of flow contribution to the system, apart from the head reach of the Cauvery main, the most important tributaries are i) the Hemavathi, ii) the Kabini and iii) the Bhavani.

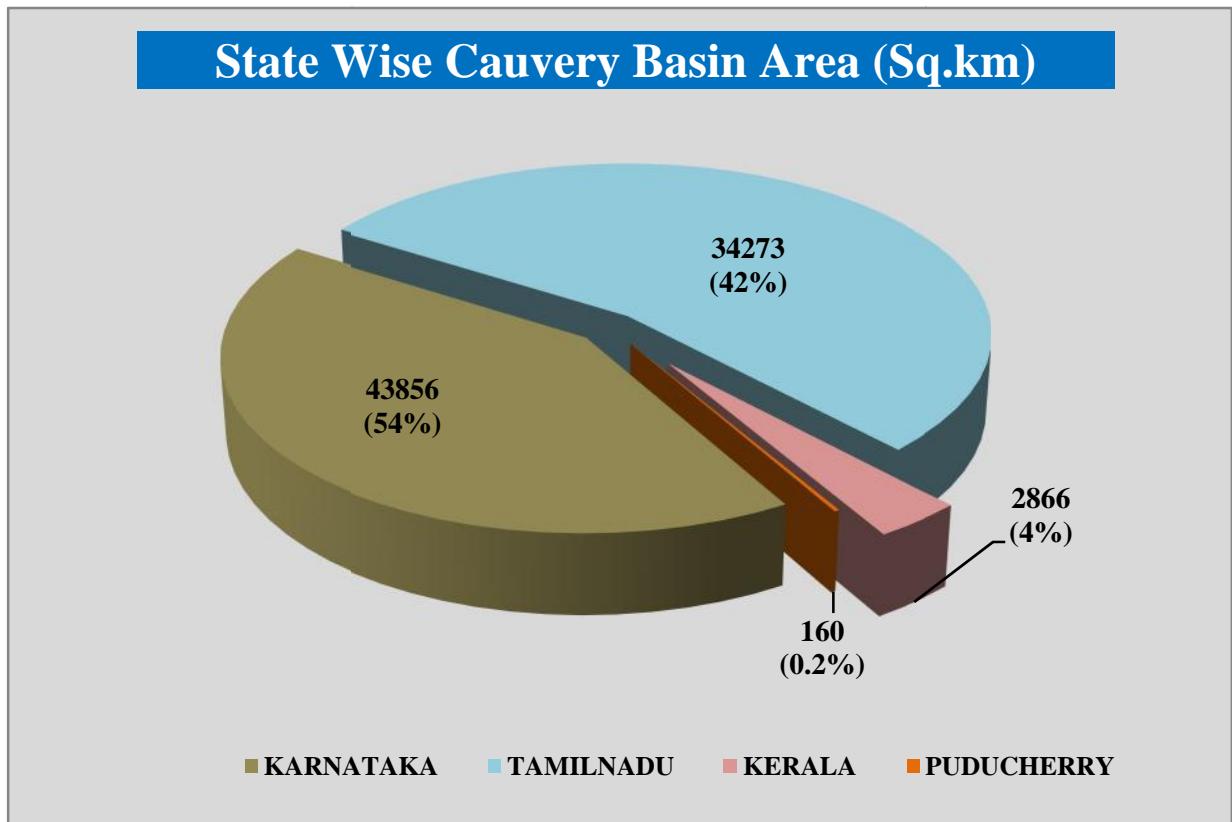

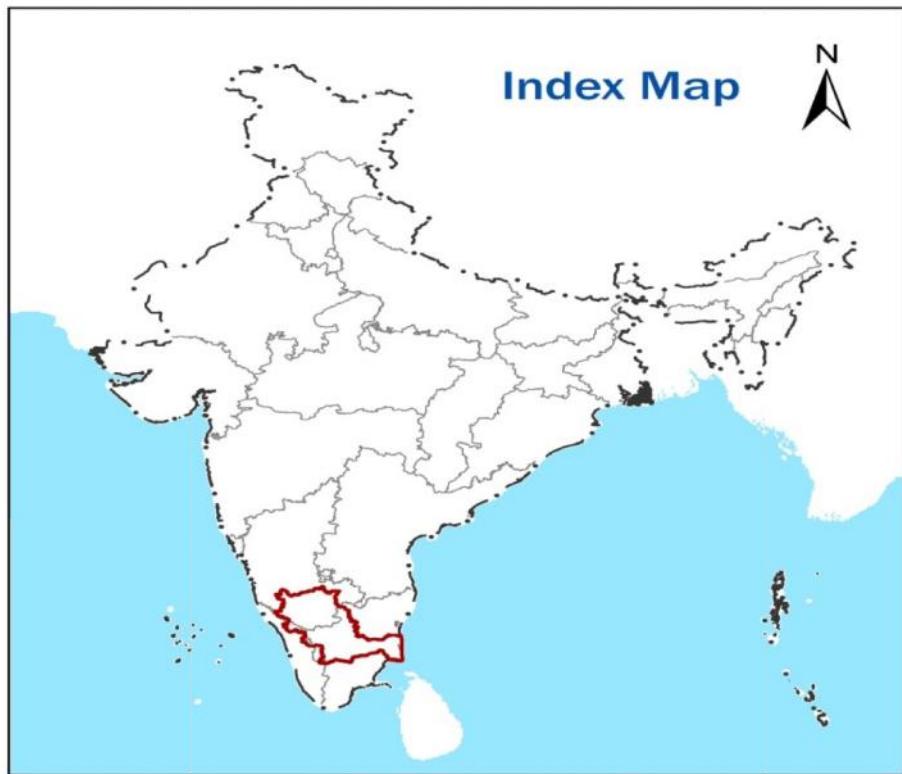

2.6.1 Irrigation Projects: Krishnaraja Sagar Dam, Bhavani Sagar Dam, Hemavathi Dam, Grand Anicut, Lower Coleroon Anicut, Kabini Dam, Harangi Dam and Mettur Dam are the major projects in the catchment areas of the river basin.

2.6.2 Hydrological Observation Sites: There are 34 H.O. sites in the basin out of which monitoring of gauge & water quality are measured at all sites, sediment observations at 15 sites.

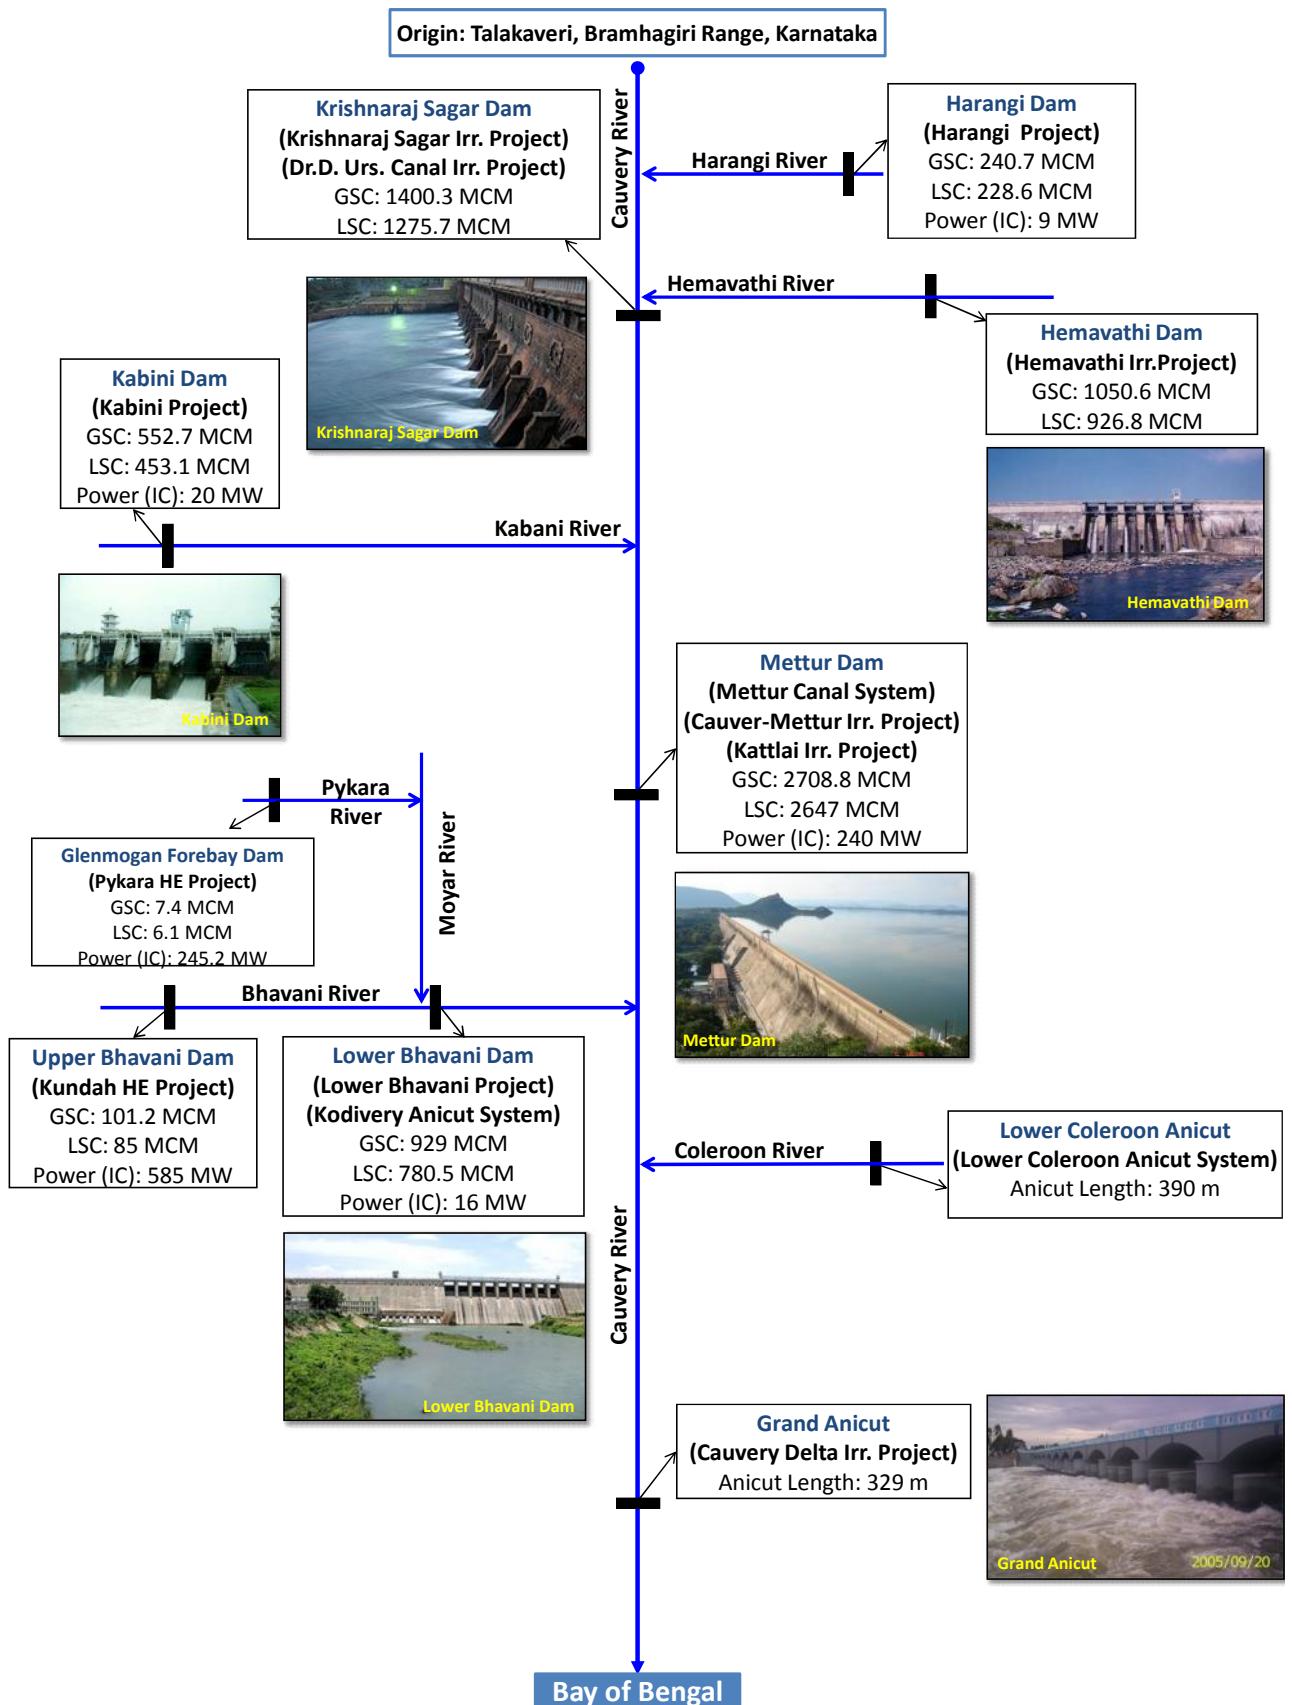

2.6.3 Peak Water level: In Cauvery basin, it is remarkable to note that four sites i.e. MH Halli, Thimmanahalli, Sakleshpur and Kudige out of 35 reported sites have registered peak water level above 800 metre. The peak water level has increased with the increase in the value of latitude with some exceptional cases.

2.6.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for seven sites of Cauvery basin (Fig 2.6.1 to Fig 2.6.12).

Cauvery River Flow Line Diagram

2.6.6 Urban Centre: Important cities on the basin are Coimbatore, Bangalore & Tiruchirapally.

2.6.7 Industries: Some of the main industries in the basin are Paper mills, Sugar mills, Chemical Factories, and Cotton mills. Mining activity in the basin includes Stone mining for building construction works.

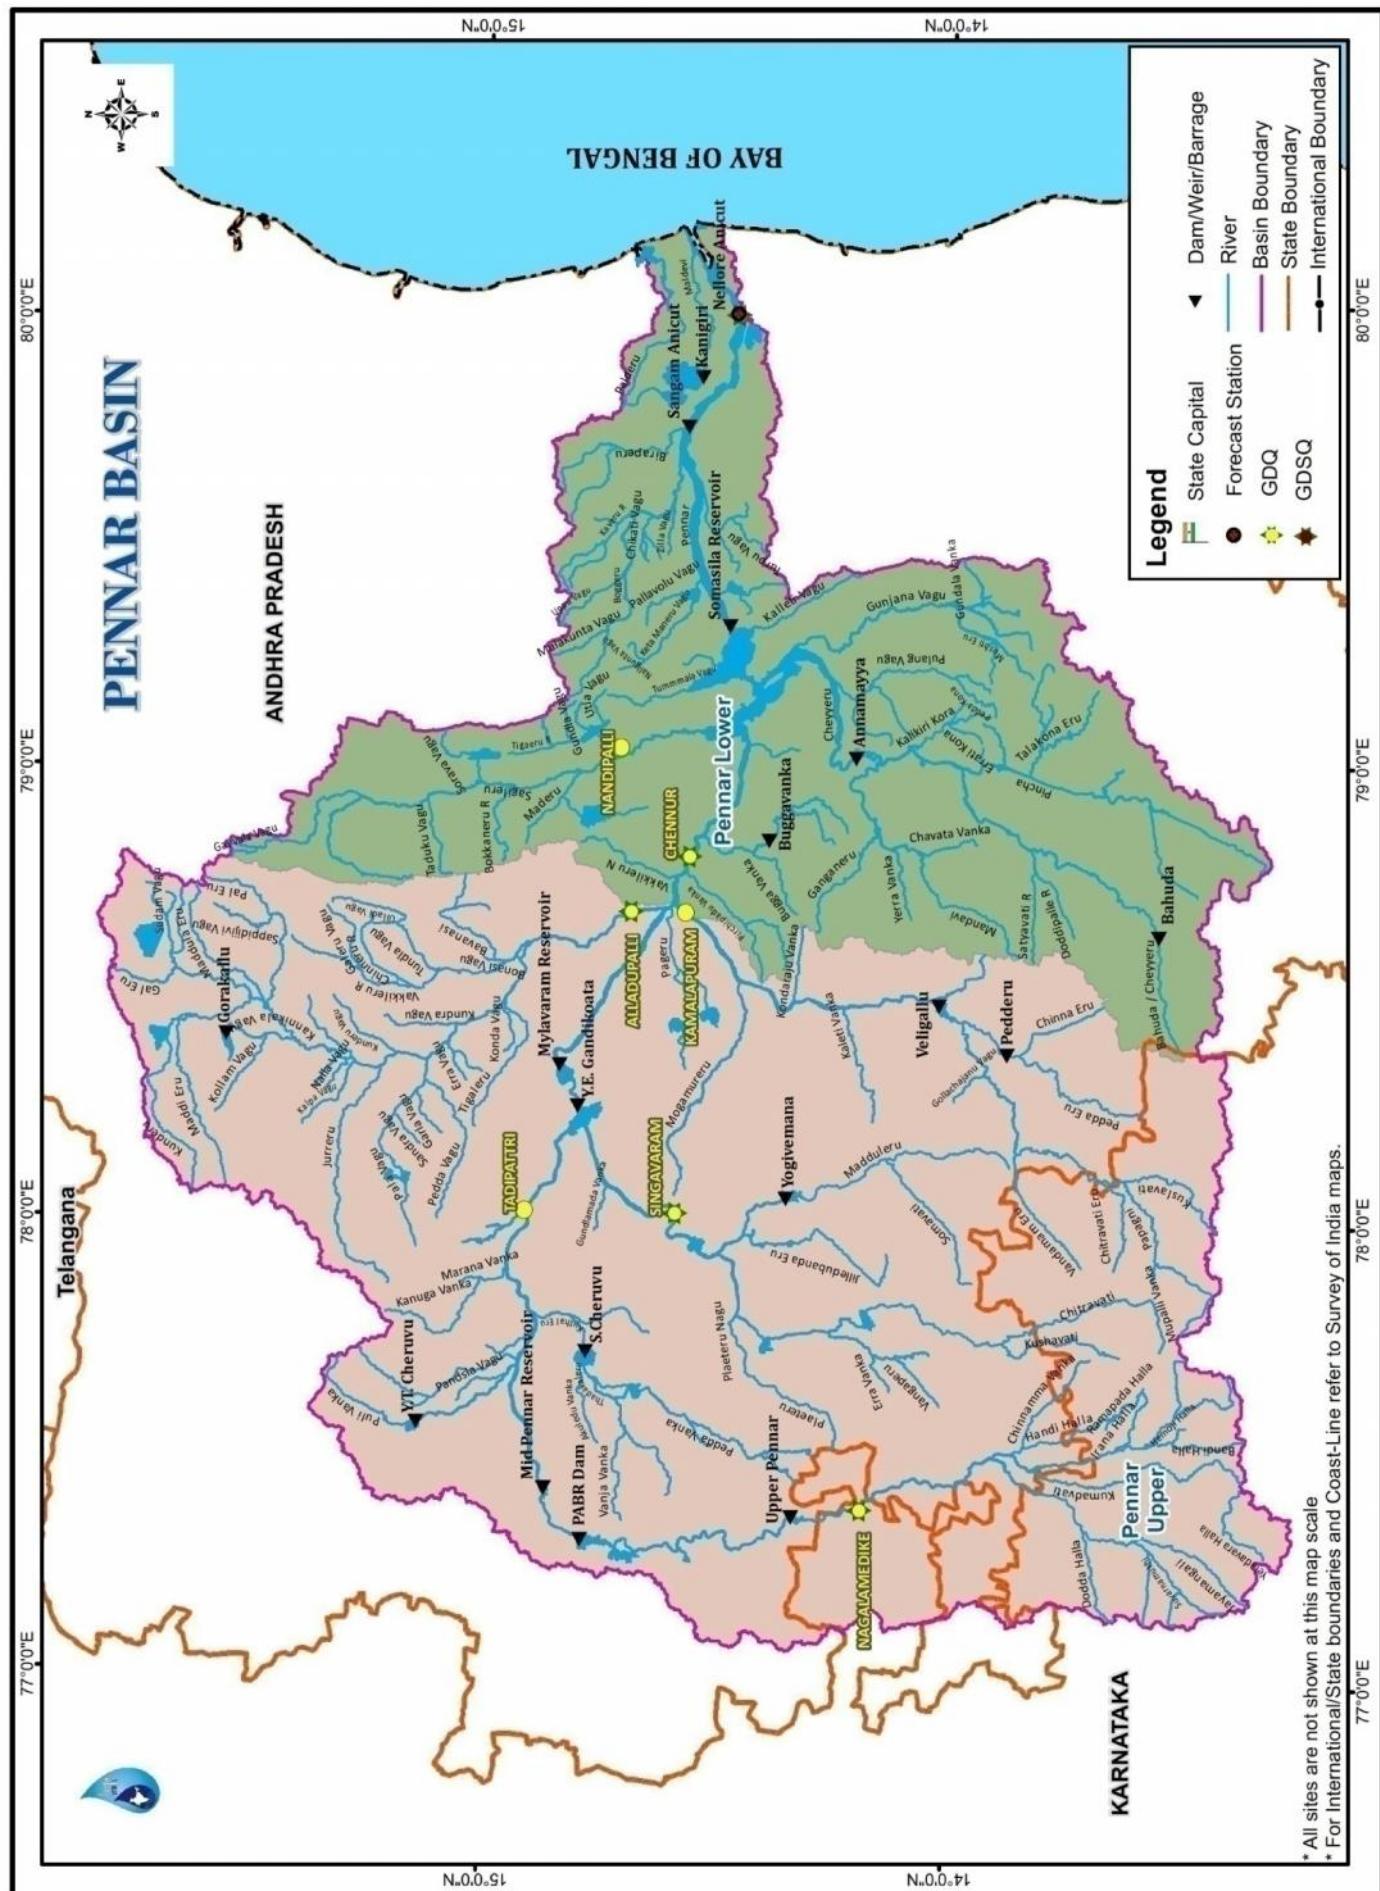

2.7 PENNAR BASIN

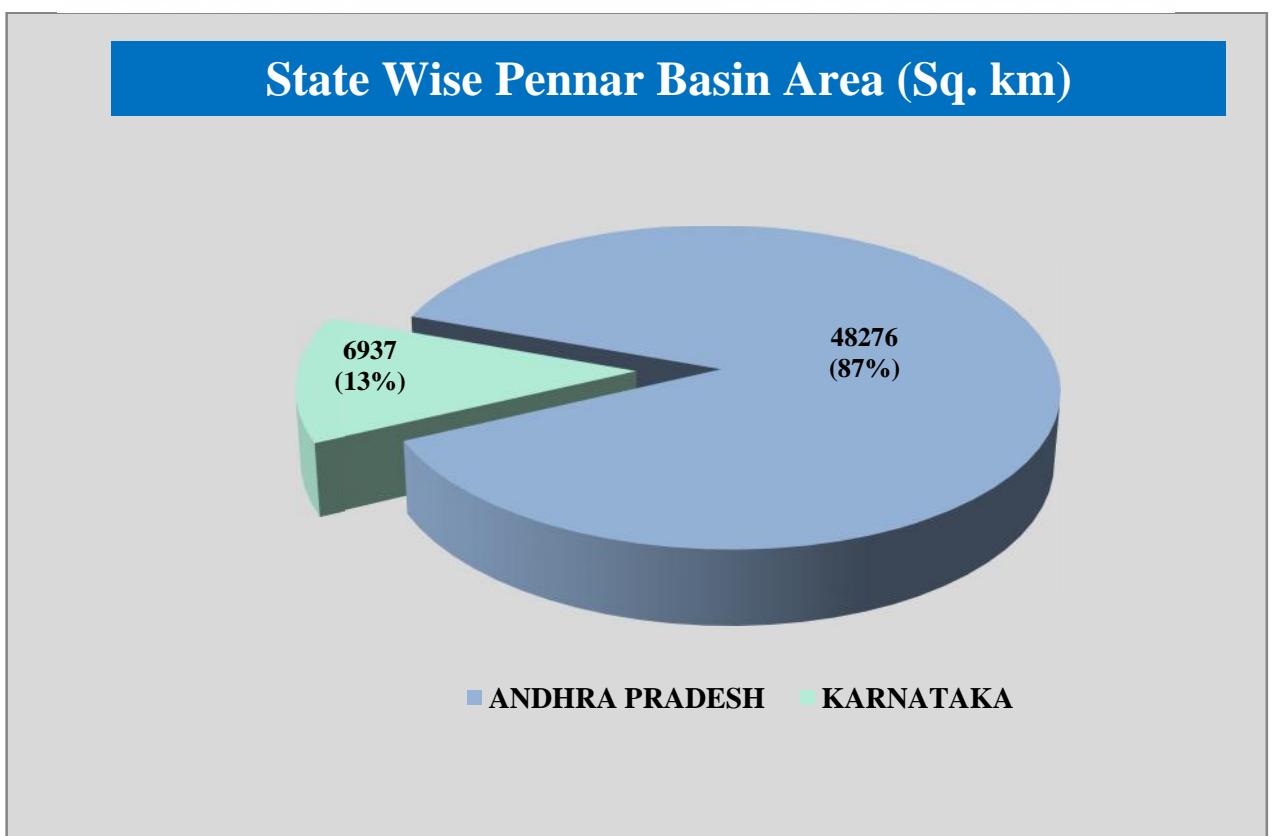

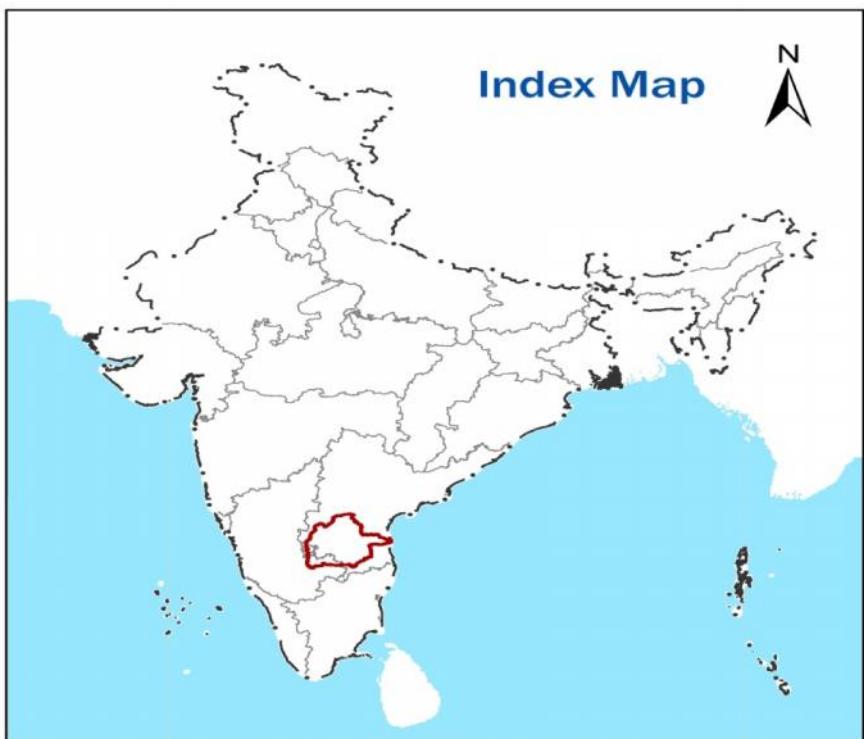

Location: The Pennar River is one of the major East Flowing Rivers in Southern India. It rises in the Chenanakesava hill of the Nandidurg range in Karnataka, flows in the north westerly direction through Kolar and Tumkur districts of Karnataka; it enters erstwhile Andhra Pradesh in the Hindupur taluk of Anantapur district, runs eastwards before draining into the Bay of Bengal near Nellore. The Basin lies between east longitude $77^{\circ} 1'$ to $80^{\circ} 10'$ and north latitude $13^{\circ} 18'$ to $15^{\circ} 49'$. The fan shaped basin is bounded by the Erramala range on the North, by the Nallamala and Velikonda ranges of the Eastern Ghats on the East, by the Nandidurg hills on the South and by the narrow ridge separating it from the Vedavati valley of the Krishna Basin on the West. The other hill ranges in the basin to the South of the river are the Seshachalam and Paliconda ranges.

The total length of Pennar river is 597 Km of which 61 Km runs in Karnataka and the rest in Andhra Pradesh. This river has six major tributaries namely, the Jayamangali, the Kunderu and the Sagileru joining from the left, the Chitravathi, the Papagni and the Cheyyeru joining on the right.

2.7.1 Major Projects: Tungabhadra RB High level Canal stage - i & ii, Somasila, Pulivendula Branch Canal, Pennar Delta are the major projects in the catchment area of the basin.

2.7.2 Hydrological Observation Stations: Central Water Commission is operating 8 Hydrological Observation sites on Main Pennar and its tributaries located at i) Nellore (GDQ), ii) Nandipalli (GDQ), iii) Chennur (GDSQ), iv) Alladupalli (GDSQ), v) Kamalapuram (GDQ), vi) Tadipatri(GDQ), vii) Nagalamadike (GDQ) and viii) Singavaram (GDQ).

2.8 EAST FLOWING RIVERS BETWEEN MAHANADI AND PENNAR BASIN

Location: The basin spreads over states of Andhra Pradesh and Odisha having an area of 86,643 Sq. km and stretches between $78^{\circ} 40'$ to $85^{\circ} 1'$ east longitudes and $14^{\circ} 34'$ to $20^{\circ} 22'$ north latitudes. It is bounded by the Eastern Ghats on the north and west, by Nallamala Range and Andra plains on the south and by the Bay of Bengal on the east.

This composite basin comprises of three river systems. The river systems between Mahanadi and Godavari covers an area of 49,685 Sq. km and the river systems between Krishna and Pennar extends over an area of 24,669 Sq. km. In addition, there is also a small area between Godavari and Krishna drained mainly by the small stream of Palleru. This minor portion of the basin has an area of about 12,289 Sq. km. The independent rivers (directly draining into Bay of Bengal) in the basin from north to south are the Rushikulya, Bahuda, Vamsadhara, Nagavati, Sarada, Varaha, Tandava, Eluru, Gundlakamma, Tammileru, Musi, Paleru and Manneru etc.

The major part of basin is covered with agricultural land accounting to 59.85% of the total area and 3.66% of the basin is covered by water bodies. The basin spreads over 19 districts (2011) comprising 11 of Andhra Pradesh and 8 of Odisha state. Brief descriptions of the major independent rivers are given below.

2.8.1 Rushikulya : The Rushikulya River is one of the east flowing rivers in Odisha. It covers entire catchment area in the districts of Kandhamal and Ganjam. The river flows through Purushottampur, Pratappur and joins with the Bay of Bengal at Ganjam district. The river Rushikulya originates at an elevation of about 1000 metre near Matabarhi village of Kandhamal district of Odisha State and lies within the geographical co-ordinates of $19^{\circ} 07'$ to $20^{\circ} 19'$ north latitude and $84^{\circ} 01'$ to $85^{\circ} 06'$ east longitude. The total catchment area is 7700 sq km. The Barhanadi, Ghodapada, Baghua and Pathama are the main principal tributaries.

2.8.2 Vamsadhara: The Vamsadhara River is an important east flowing river between Mahanadi and Godavari. The river originates near Lanjigarh village in Kalahanadi district in Odisha and traverses a total distance of about 221 km before it joins the Bay of Bengal at Kalingapatnam in erstwhile Andhra Pradesh. It has five principal tributaries viz. Chauldua, Phalphalia, Ganguda (Harbhangi), Sanna Nadhi and Mathendrathanaya. Most of its catchment area falls on the left. The basin is narrow and full of undulations. It is situated within the geographical co-ordinates of $18^{\circ} 15'$ to $19^{\circ} 55'$ north latitudes and $83^{\circ} 20'$ to $84^{\circ} 20'$ east longitudes. The total catchment area of this basin works out to 10,830 Sq km.

2.8.3 Sarada: The Sarada River, an east flowing medium sized river, lies in the district of Visakhapatnam of erstwhile Andhra Pradesh. The geographical co-ordinates of the river are north latitude $17^{\circ} 25'$ to $18^{\circ} 17'$ and east longitude $82^{\circ} 32'$ to $83^{\circ} 06'$. The basin is surrounded by Nagavali in the north, Gostari, Gambi Ramgedda, Megadnigedda in the east, Bay of Bengal in the south and Machhkund sub-basin of the Godavari in the west. The catchment area of the basin is 2665 sq km. It rises at an elevation of 1000 metre near Longuparu village and traverses a distance of 104 km before joining the sea. The average rainfall is 1000 mm.

2.8.4 Nagavali : The Nagavali river is a medium sized east flowing river in peninsular India and lies within the geographical co-ordinates of north latitude $18^{\circ} 10'$ to $19^{\circ} 44'$ and east longitudes of $82^{\circ} 53'$ and $84^{\circ} 05'$. It is surrounded by Vamsadhara in the north, Champavathi and Peddagedda in the south, Godavari in the west and the Bay of Bengal in the East. It drains parts of the districts of Kalahandi, Rayagada, Koraput of Odisha and Srikakulam,

Vijayanagaram and Visakhapatnam of erstwhile Andhra Pradesh state. The total catchment area is 9510 sq km with an average rainfall of 1000 mm. The Nagavali River originates near the Lakhbhal in Kalahandi district (Odisha) at an elevation of about 1300m. The total length of the river run is 217 km. The important tributaries are Nagavali, Janjhvati, Suvarnamukhi, and Vegavathi.

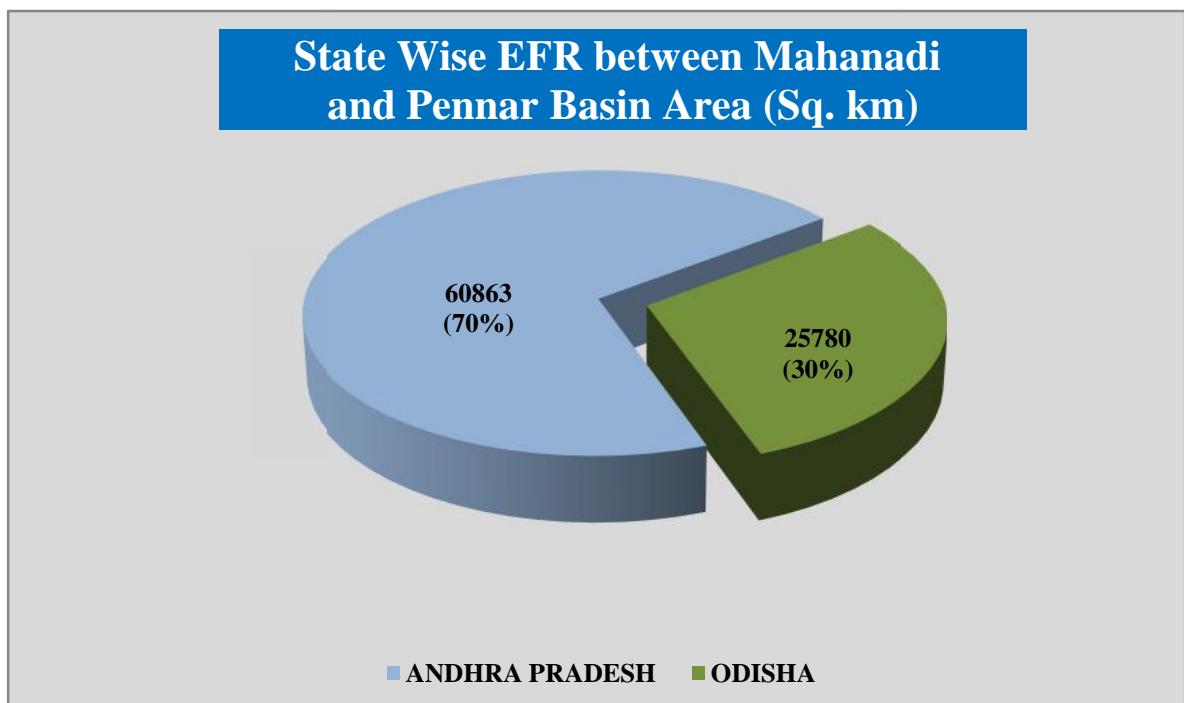

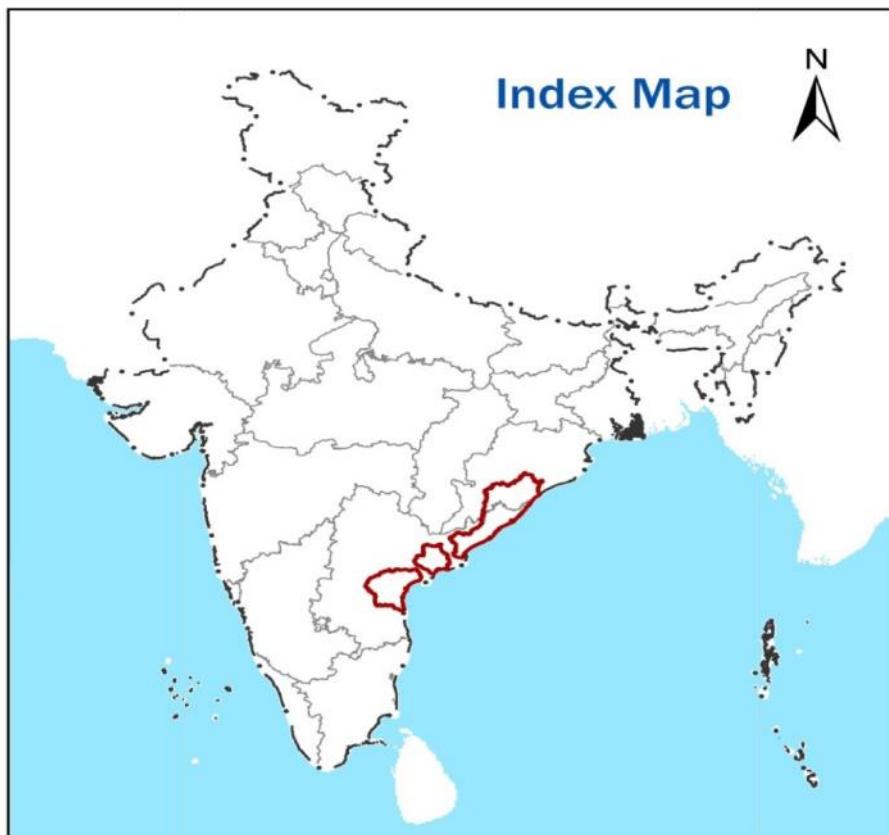

2.8.5 Gundlakama: The Gundlakama river rises near Iskagundam village in Kurnool district at an elevation of 600 metre from the eastern slopes of the Nallamala hills at north latitude $15^{\circ} 38'$ and east longitude $78^{\circ} 47'$ and flows in a north-east, east and southern direction for a total length of 220 km to join the Bay of Bengal. The total area drained by this river is 8,494 sq km and total catchment area for the river is 7681 sq. km. The Kandleru is its important left bank tributary. There is one H.O. site for each for Gauge, Discharge, Sediment and Water Quality.

2.8.6 Paleru: The Paleru river rises from near Gogulapalle Village in Nellore District of Andhra Pradesh at an elevation of 325 metre and flows for a total length of 104 Km. The catchment area of the river is 2,483 Sq. Km which lies entirely in Andhra Pradesh. The river basin lies at north latitude $15^{\circ} 17'$ and east longitude $79^{\circ} 13'$. Paleru Bitragunta Irrigation Project is a medium project which benefitted the Prakasam district.

2.8.7 Irrigation Projects: The Rushikulya Irrigation System is the only Major Irrigation Project in the catchment area of the Rushikulya River Basins. The Gotta barrage project in Vamsdhara basin, the Thotapally, Narayan Puram and Jaiyavathi are the major irrigation projects in the catchment areas of the Nagavali river basin.

2.8.8 Hydrological Observation Sites: There are 13 Hydrological observation sites in the basin, of which 7 sites are of Gauge only, 2 sites for Gauge & Discharge (GD) and 4 sites are of GDSQ type (as per 2014-15 data).

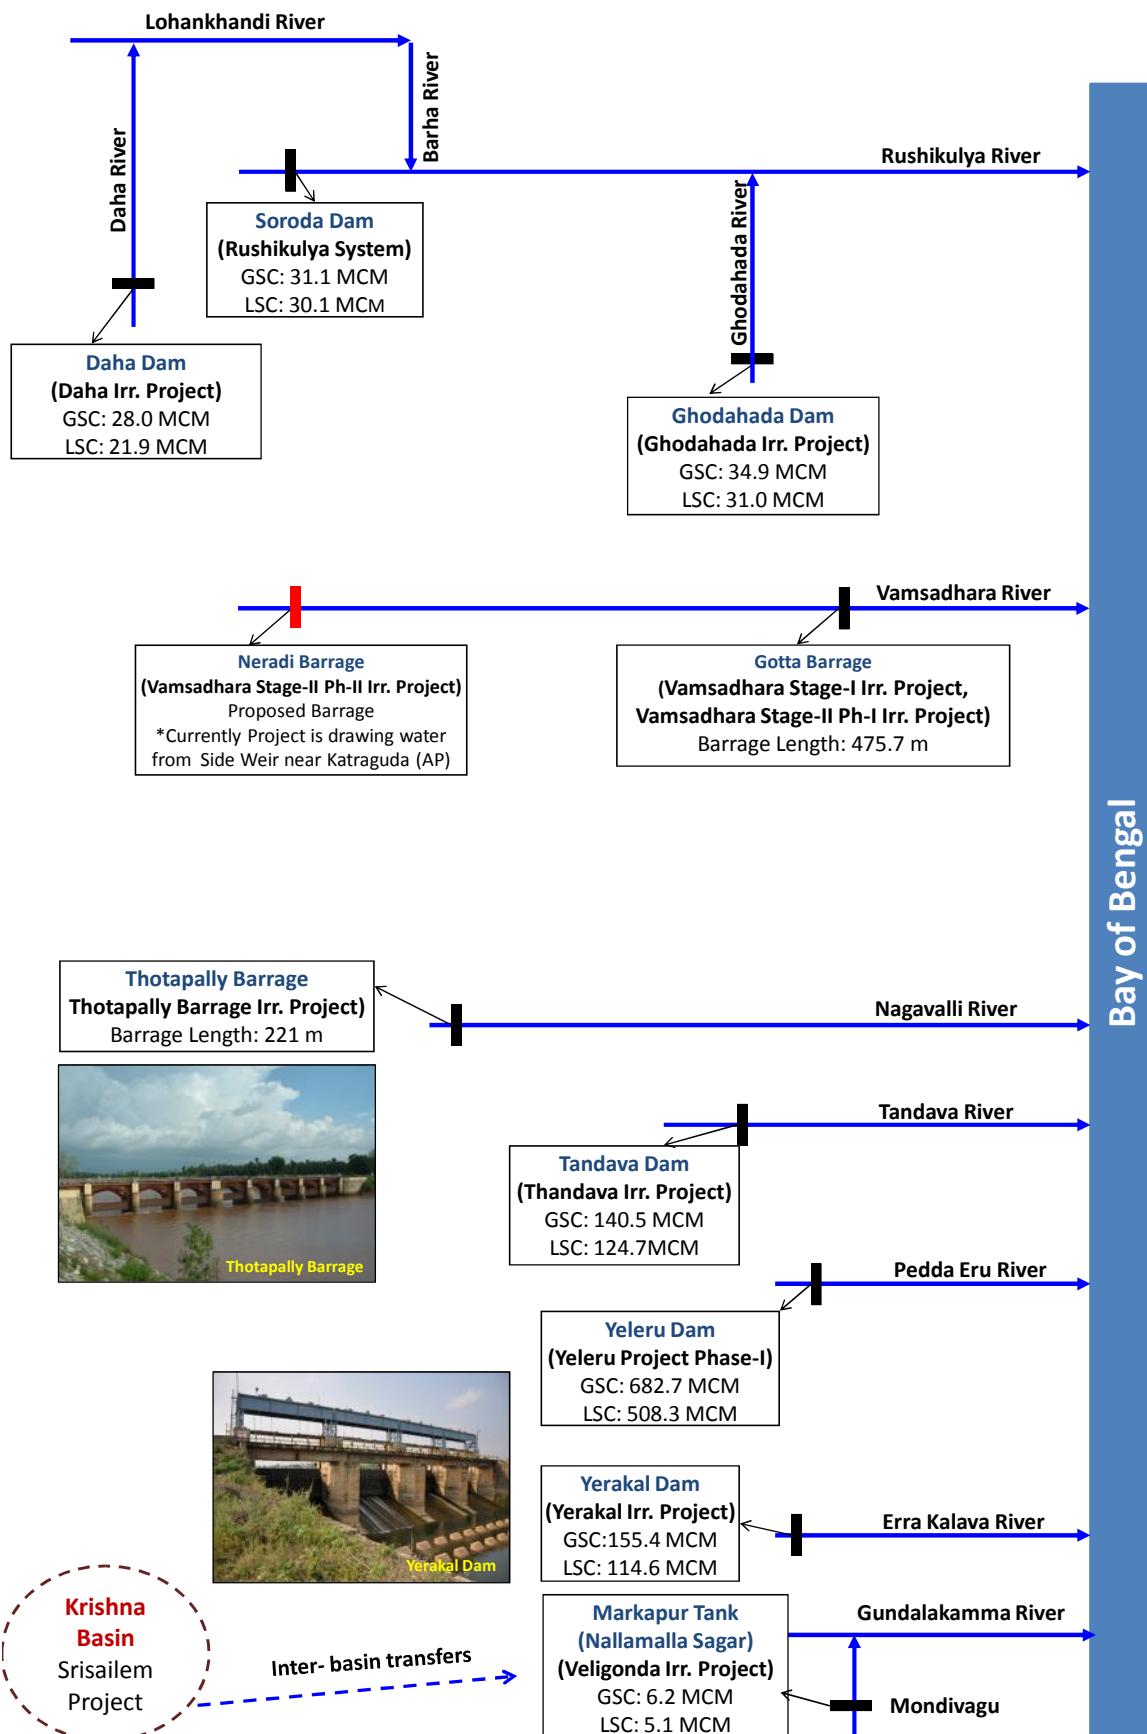

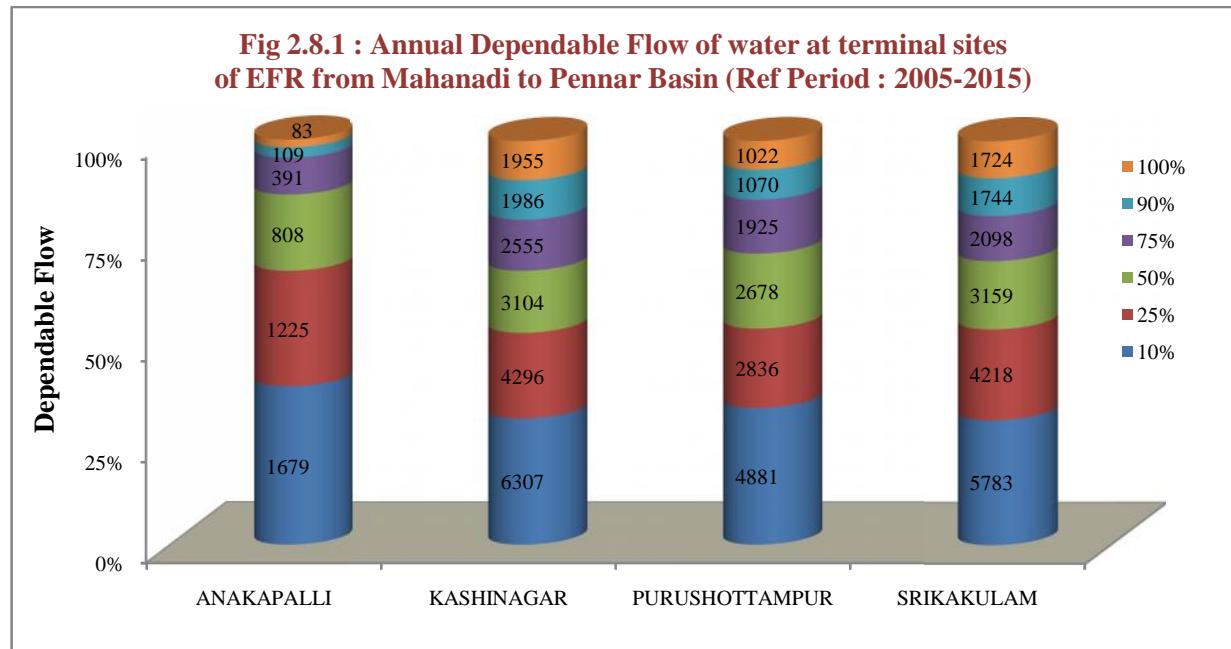

EFR between Mahanadi and Pennar Flow Line Diagram

2.8.9 Urban Centres: Behrampur city, Ganjam and Sorada are situated in the basin. Srikakulam, Gunupur, Visakhapatnam and Vijayanagaram are other important towns in the basin.

2.8.10 Industries: Major industries in the basin are chemical, sugar, Spinning Mills and Steel plants.

2.8.11 Minerals: The basin is rich in mineral wealth. The major economic minerals are clay, lime stone, manganese, graphite, mica, bauxite, aluminium, fire clay, quartz, sand talc, black sand and grinding materials.

2.9 EAST FLOWING RIVERS FROM PENNAR TO KANYAKUMARI BASIN

Location: The basin extends over states of Tamil Nadu, Andhra Pradesh, Karnataka and Union Territory of Puducherry having a total area of 1,02,287.9 sq. km (*GIS Calculated as per India-WRIS Database*) and accounts for nearly 3.08% of the total geographical area of the country. The basin extends between $77^{\circ}1'$ to $80^{\circ}17'$ east longitudes and $8^{\circ}11'$ to $14^{\circ}27'$ north latitudes. It is bounded by the Eastern Ghats on the north, by Tamil Nadu uplands on the west, by the Indian Ocean on the south and by the Bay of Bengal on the east.

The composite basin comprises of the river systems between Pennar and Cauvery having an area of 63,646.2 Sq.km and the river systems between Cauvery and Kanyakumari with an area of 38,646.1 Sq.km. The independent rivers (directly draining into Bay of Bengal) are the Kandleru, the Swarnamukhi, the Arani, the Korttalaiyar, the Cooum, the Adyar, the Palar, the Gingee, the Ponnaiyar, the Vellar, the Varshalei, the Vaigai, the Gundar, the Vaippar and the Tambraparni. The basin is comprised of four sub-basins; Vaippar and others Sub-basin, the Palar and other sub-basin, Pamba and others sub-basin and Ponnaiyar and other sub-basin. The salient features for the basin are described in Table 2 (2.9).

The major part of basin is covered with agricultural land accounting to 66.65% of the total area, forest area comprising of 15% of the basin area and 9.02% of the basin is covered by waterbodies. The utilizable surface water is around 16.50 BCM whereas average annual water potential is 16.46 BCM. The total number of watersheds in this basin is 165. On the basis of the 2001 Census, the total population in this basin is about 3,55,50,515. The basin spreads over forty-nine parliamentary constituencies (2009) comprising of thirty-two in Tamil Nadu, six of Karnataka, five of Andhra Pradesh, five of Kerala and one of Puducherry.

Brief descriptions of the rivers flowing in the basin are given below.

2.9.1 Swarnamukhi: The Swarnamukhi is an East Flowing river basin having a small catchment Area of 3,225 sq km. It rises at an elevation of 300 metre in the Eastern Ghat ranges near Pakada village in Chittur district of erstwhile Andhra Pradesh at North latitude $13^{\circ} 28'$ and east longitude $79^{\circ} 09'$. It runs generally in north eastern direction passing through the famous Tirupati hills before joining into the Bay of Bengal. This Independent river has no major tributaries and therefore its flow depends only on rainfall in its upper catchment. There is one H.O. site for each for Gauge, Discharge, Sediment and Water Quality.

2.9.2 Kalingi: The Kalingi River is one of the East flowing rivers in erstwhile Andhra Pradesh. It originates near Kalahasti in erstwhile Andhra Pradesh and drains completely in erstwhile Andhra Pradesh and joins in Pulicat lake after Sulurpet. The catchment area of Kalingi River is 5,927 sq km and the length is 76 km. The important tributary is Kalleru river which joins Kalingi River after Sulurpet town. There is one H.O. site for each for Gauge, Discharge, Sediment and Water Quality.

2.9.3 Palar: The Palar basin is an important basin among the 12 basins lying between the Pennar and the Cauvery basin. This basin is divided into three major topographical divisions namely, (i) the hill ranges of Eastern Ghats (ii) the plateau region and (iii) the coastal plains. Though most of the drainage area lies in Tamil Nadu, its drainage area extends to cover the southeast and southwest parts of Karnataka and erstwhile Andhra Pradesh respectively. The shape of the basin is rhombus. The basin finds its outlet into Bay of Bengal. The Palar drains an area of 17,871 sq km out of which nearly 57 percent lies in Tamil Nadu and the balance in

the states of Karnataka and erstwhile Andhra Pradesh. Each of Gauge, Discharge and Water Quality type of H.O. sites are having 3 sites.

2.9.4 Ponnaiar: The Ponnaiar basin is the second largest inter-state East Flowing river basin among the 12 basins lying between the Pennar and the Cauvery basins. It covers a large area in the state of Tamil Nadu, besides the areas covered in the states of Karnataka and erstwhile Andhra Pradesh. It lies between the east longitudes $77^{\circ} 33'$ to $79^{\circ} 47'$ and north latitudes $11^{\circ} 45'$ to $13^{\circ} 30'$. This basin is bounded in the northwest and south by various ranges of the Eastern Ghats like the Velikonda range, the Nagari hills, the Javadu hills, the Shevaroy hills, the Chitteri hills and the Kalrayan hills and in the east by the Bay of Bengal. The Ponnaiyar drains an area of 16,019 Sq km out of which nearly 77 percent lies in Tamil Nadu. The Ponnaiar or the Dakshina Pinakini river rises near Hongashenhalli village at an elevation of about 900m above msl in the Kolar district of Karnataka state. From its origin, the river Ponnaiar generally flows in the southern direction through Kolar and Bangalore districts of Karnataka to a length of 79 km before entering the Dharmapuri district of Tamil Nadu. The river flows another 247 km generally in the south east direction in the districts of Dharmapuri, Vellore, Tiruvannamalai, Cuddalore and Villupuram districts. Then, the river flows in the eastern direction below the Tirukoyilur anicut for another 70 km before finding its way into the Bay of Bengal. The river Ponnaiar branches into two, the Gadilam near Cuddalore and the Ponnaiyar near the Union Territory of Puducherry. On its way, the river Ponnaiyar receives a number of small streams and rivulets. Krishnagiri and Sathanur Reservoir are the major projects in the catchment areas of the river basin. There are 3 H.O. sites out of which 3 are Gauge, 3 are discharge, 3 for Water Quality and 2 for Sedimentation.

2.9.5 Vellar: The Vellar River rises at an elevation of 900 metre near the village of Tumba in the Chottori hills, of the Eastern Ghats in the Salem district of Tamil Nadu. It flows generally in an easterly direction for a total length of 210 Km through Salem and Cuddalore districts in Tamil Nadu and finally out falls into the Bay of Bengal near Porto Nova in Cuddalore district. It drains a total catchment area of about 8,922 sq km. The Gomukinadhi and Manimukthanadi are the important left bank tributaries and Swetanadhi and Chinnar are the right bank tributaries of the Vellar. There is one H.O. site each for Gauge, Discharge and Water Quality.

2.9.6 Vaigai: The Vaigai basin is an important basin among the 12 basins lying between the Cauvery and Kanyakumari. The basin is bounded by the Varushanadu hills, the Andipatti hills, the Cardaman hills and the Palani hills on the west and the Palk Strait and Palk Bay on the east. This basin is divided into two major topographical divisions namely (i) the hilly areas and (ii) the plains. The basin is elongated in shape and drains into the Palk Bay. The Vaigai drains an area of 7,741 sq km which entirely lies in the state of Tamil Nadu.

The Vaigai river rises on the eastern slopes of the Varushanadu hills at an elevation on 1,200m above msl near Kottamalai in the Madurai district at a north latitude $9^{\circ} 32'$ and east longitude $77^{\circ} 23'$ and flows in the northerly and north easterly directions up to its confluence with the Varahanadi and then takes a turn towards east and south east to flow through Madurai, Sivagangai and Ramanathapuram districts. On its way, the Vaigai receives two important tributaries namely the Suruliyar and the Manjalar on its left bank, besides a large number of small streams and rivulets. The river has been dammed downstream of its confluence with the Suruliyar tributary.

The Suruliyar and the Manjalar, the two important left bank tributaries together account for nearly 20 percent of the total catchment area of the Vaigai. The Suruliyar is the principal tributary of the Vaigai also rises in the eastern slopes of the Varushanadu hills and flows in the north and north eastern direction. It receives Theniar on its left bank just before its confluence

with the Vaigai. The Manjalar another major tributary rises in the Palani hills and flows generally in the easterly direction before joining the Vaigai below the Vaigai dam. The Vaigai also receives another minor tributary namely the Varahanadi on its left bank below the Vaigai dam. The Vaigai Reservoir is a major project in the catchment area of the basin. There are H.O. sites with 3 for each of Gauge, Discharge, Sedimentation and Water Quality.

2.9.7 Vaippar: The Vaippar River rises on the eastern slopes of the Varushanadu hill ranges of the Western Ghats near Sivagiri in Thirunelveli district in Tamilnadu at an elevation of about 900m. It flows generally in an easterly direction for a length of about 125 km through Thirunelveli, Virudhunagar and Tuticorin districts in Tamilnadu and joins the Gulf of Mannar near Kalattur. The river basin is located on south of Vaigai. It drains a total catchment area of 5,069 sq km. The catchment area lies entirely in Tamilnadu. The Arjunanadhi and Vijayanadhi are the important tributaries on the left bank. There is one H.O. site for each of Gauge, Discharge and Water Quality.

2.9.8 Tambraparani: The Tambraparani river rises on the eastern slopes of the Western Ghats at an elevation of about 1,400m at north latitude $8^{\circ} 46'$ and east longitude $77^{\circ} 15'$ near Alwarkurichi village in Thirunelveli district of Tamilnadu to flow in a generally easterly direction for a total length of 130 km and joins the Gulf of Mannar. The Chittar and Manimuthar are the left & right bank tributaries of this river. The total area drained by the Tambraparani is 5,482 sq km. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.9.9 Varahanadi: The main river Varahanadi originates from the Northern part of Pakkamalai hills at an elevation of 5660 metre above m.s.l, in the western slopes past of Gingee Taluk. The total area of the basin is 2564 Sq. Kms. The total length of Varahanadi up to its outfall into Bay of Bengal, a little South of Puducherry state, is about 78.50 kms. There is one H.O. site on this stream at Kumarapalayam being operated by Central Water Commission. There is one H.O. site for each of Gauge, Discharge and Water Quality.

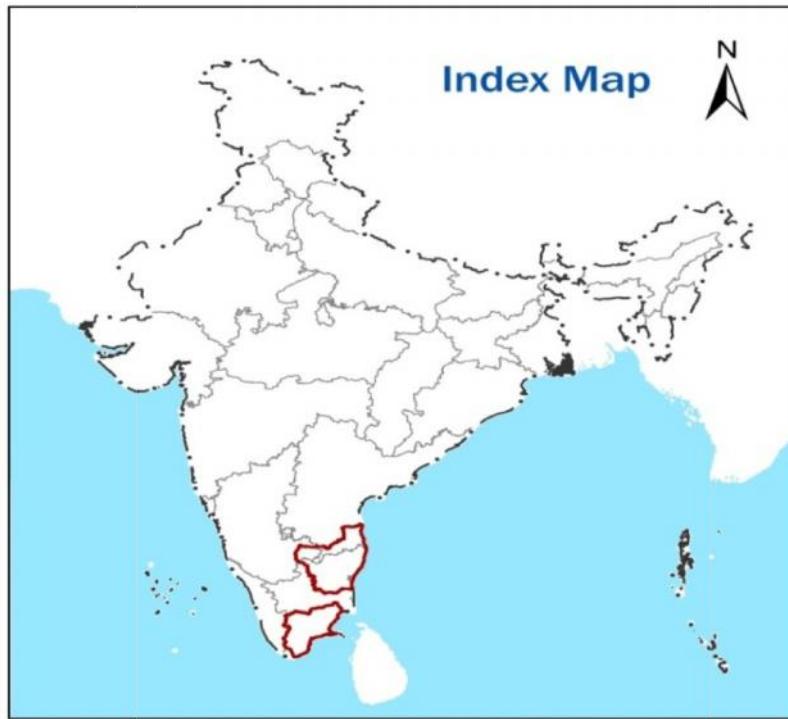

2.9.10 Irrigation Projects: The Somashila in the sub-basin of Pennar, Krishnagiri and Sathanur in the sub-basin of Ponniar, Vaigai reservoir in the sub-basin of Vaigai are the major projects in the catchment areas of the west flowing river basin.

2.9.11 Hydrological Observation Sites: There are 17 sites in the basin for recording observations on water quality, gauge and discharge. Sediment observations are made at 5 of these stations (as per 2014-15 data). (See Table 3)

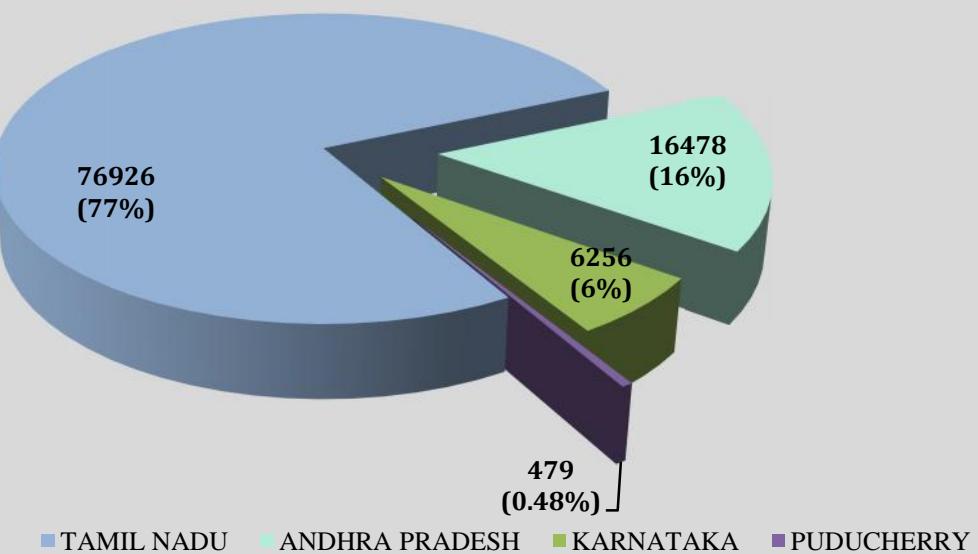

2.9.12 Peak Water Level: Most of the sites have not registered significant peak water level in the basin. Only four sites have registered 200 metre or above peak water level out of 17 reported sites during the reference period 2014-15. The maximum peak water level was observed at Gummanur site (495.60 metre) on 24.10.2005, which is highly significant as compared to observations made at other reporting sites.

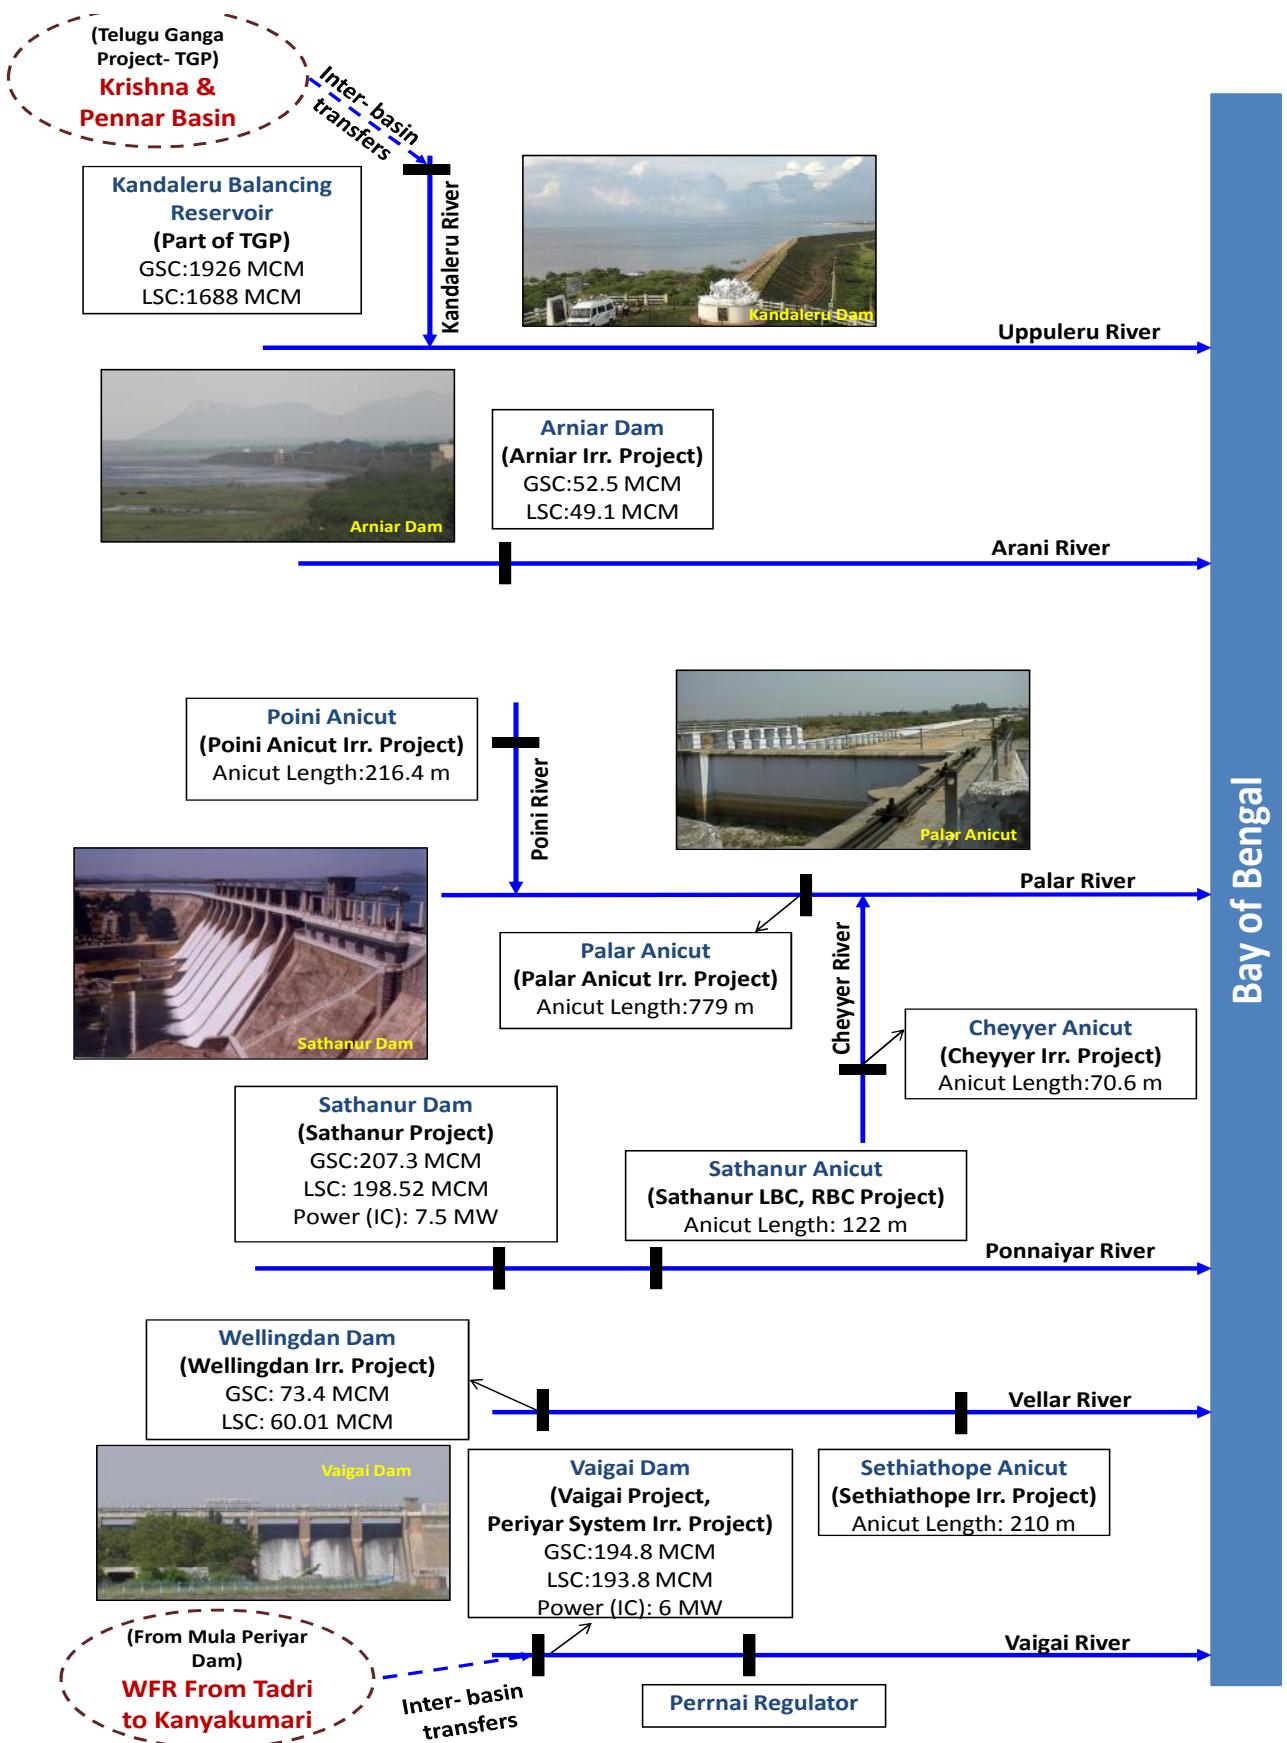

2.9.13 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, Total hardness are given below for three sites of the basin (Fig 2.9.1 to Fig 2.9.9).

State Wise EFR from Pennar to Kanyakumari Basin Area (Sq. km)

2.9.15 Minerals: Important minerals found in the basin are Lime Stone, Sand Stone, Quartzite and Dolomite.

2.10 NARMADA BASIN

Location: The Narmada is the largest west flowing and fifth largest river of India. It drains an area of 98,796 sq km out of which nearly 87% lies in Madhya Pradesh besides some areas in the states of Maharashtra and Gujarat. The Narmada basin lies between east longitudes $72^{\circ} 32'$ to $81^{\circ} 45'$ and north latitudes $21^{\circ} 20'$ to $23^{\circ} 45'$. It flows through Deccan trap in between Vindhya and Satpura ranges of hills before flowing into the Gulf of Cambay in the Arabian Sea.

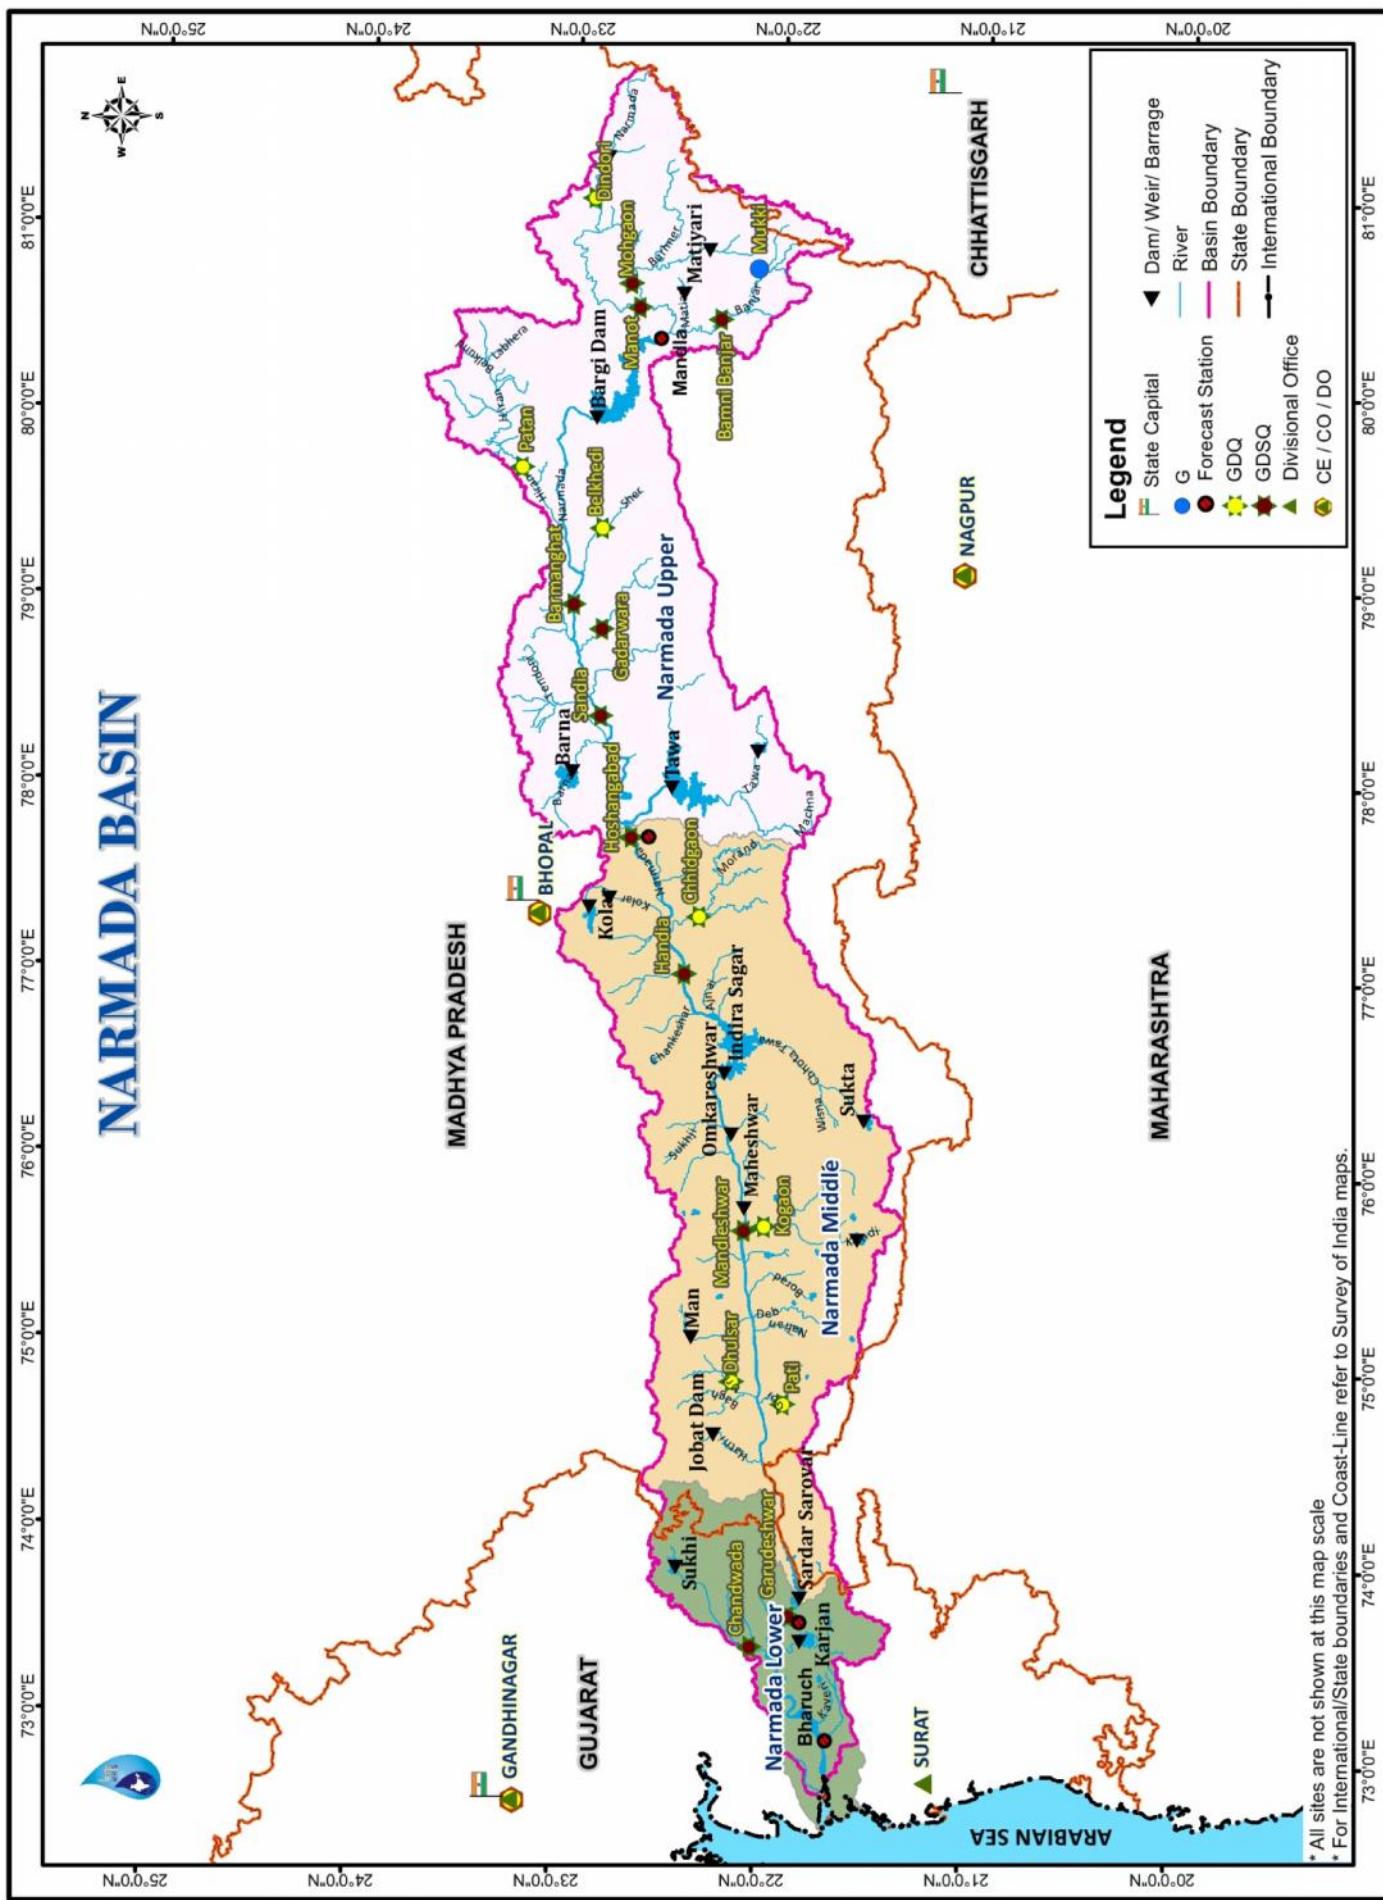

The Narmada originates from a Kund (spring) at an elevation of 1057m at Amarkantak in the Maikal hill in Shahdol district of Madhya Pradesh and flows through Madhya Pradesh, Maharashtra and Gujarat between Vindhya and Satpura hill ranges before falling into the Gulf of Cambay in the Arabian Sea, about 10 km north of Bharuch district of Gujarat. The total length of this west flowing river from its origin to its outfall into the Sea is 1,312 km. For the first 1,079 km, it runs in Madhya Pradesh and thereafter it forms the common boundary between Madhya Pradesh and Maharashtra for 35 km, and Maharashtra and Gujarat for 39 km. In Gujarat State, it stretches for 159 km. There are 41 important tributaries to the Narmada River. Significant among them are Burhner, Banjar, Hiran, Tawa, Chhota Tawa, Orsang and Kundi which are major tributaries having catchment area of more than 3,500 sq km. The remaining tributaries are having catchment areas ranging from 500 to 2,500 sq km. Temperature of Narmada basin is like any other part of Central India. In general, the upper Narmada basin records lower temperature as compared to middle basin.

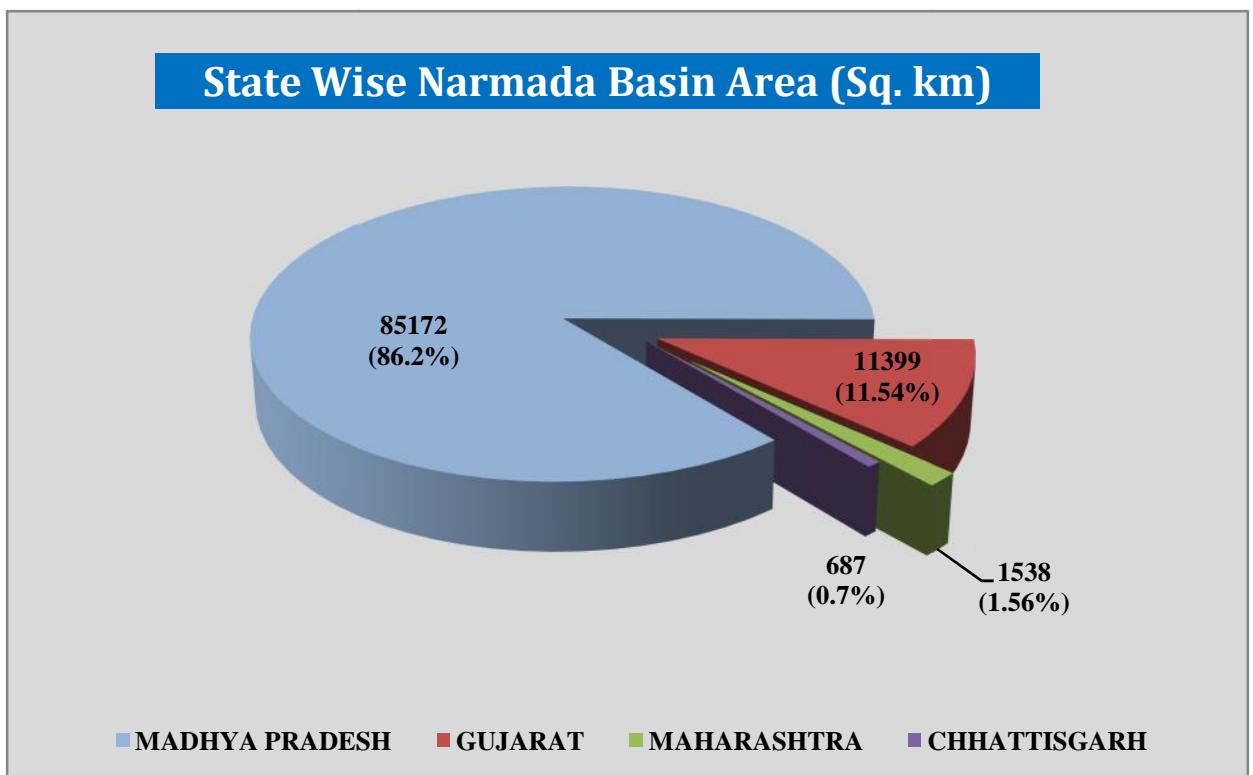

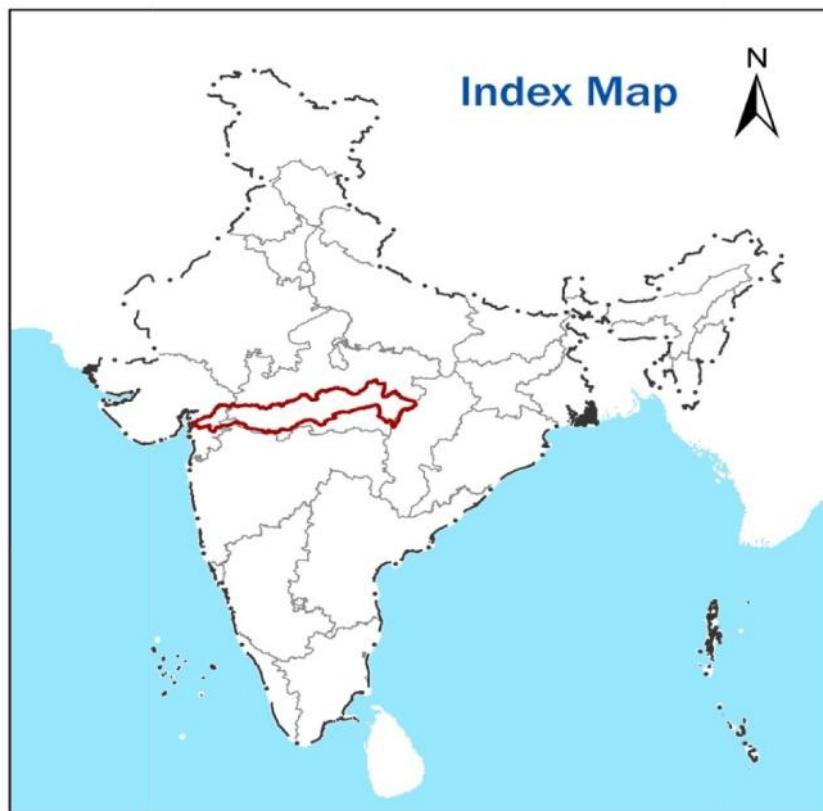

2.10.1 Irrigation Projects: Karjan, Sardar Sarover, Jobat, Man, Upper Beda, Maheshwar, Indira Sagar, Sukta, Kolar, Tawa, Barna, Bargi, Matiyari are the major projects in the catchment areas of the river basin.

2.10.2 Hydrological Observation Sites: There are total 19 H.O sites in the basin out of which 18 are for recording observations on Water Quality along with gauge and discharge. Sediment observations are made at 11 of these stations (as per 2014-15 data).

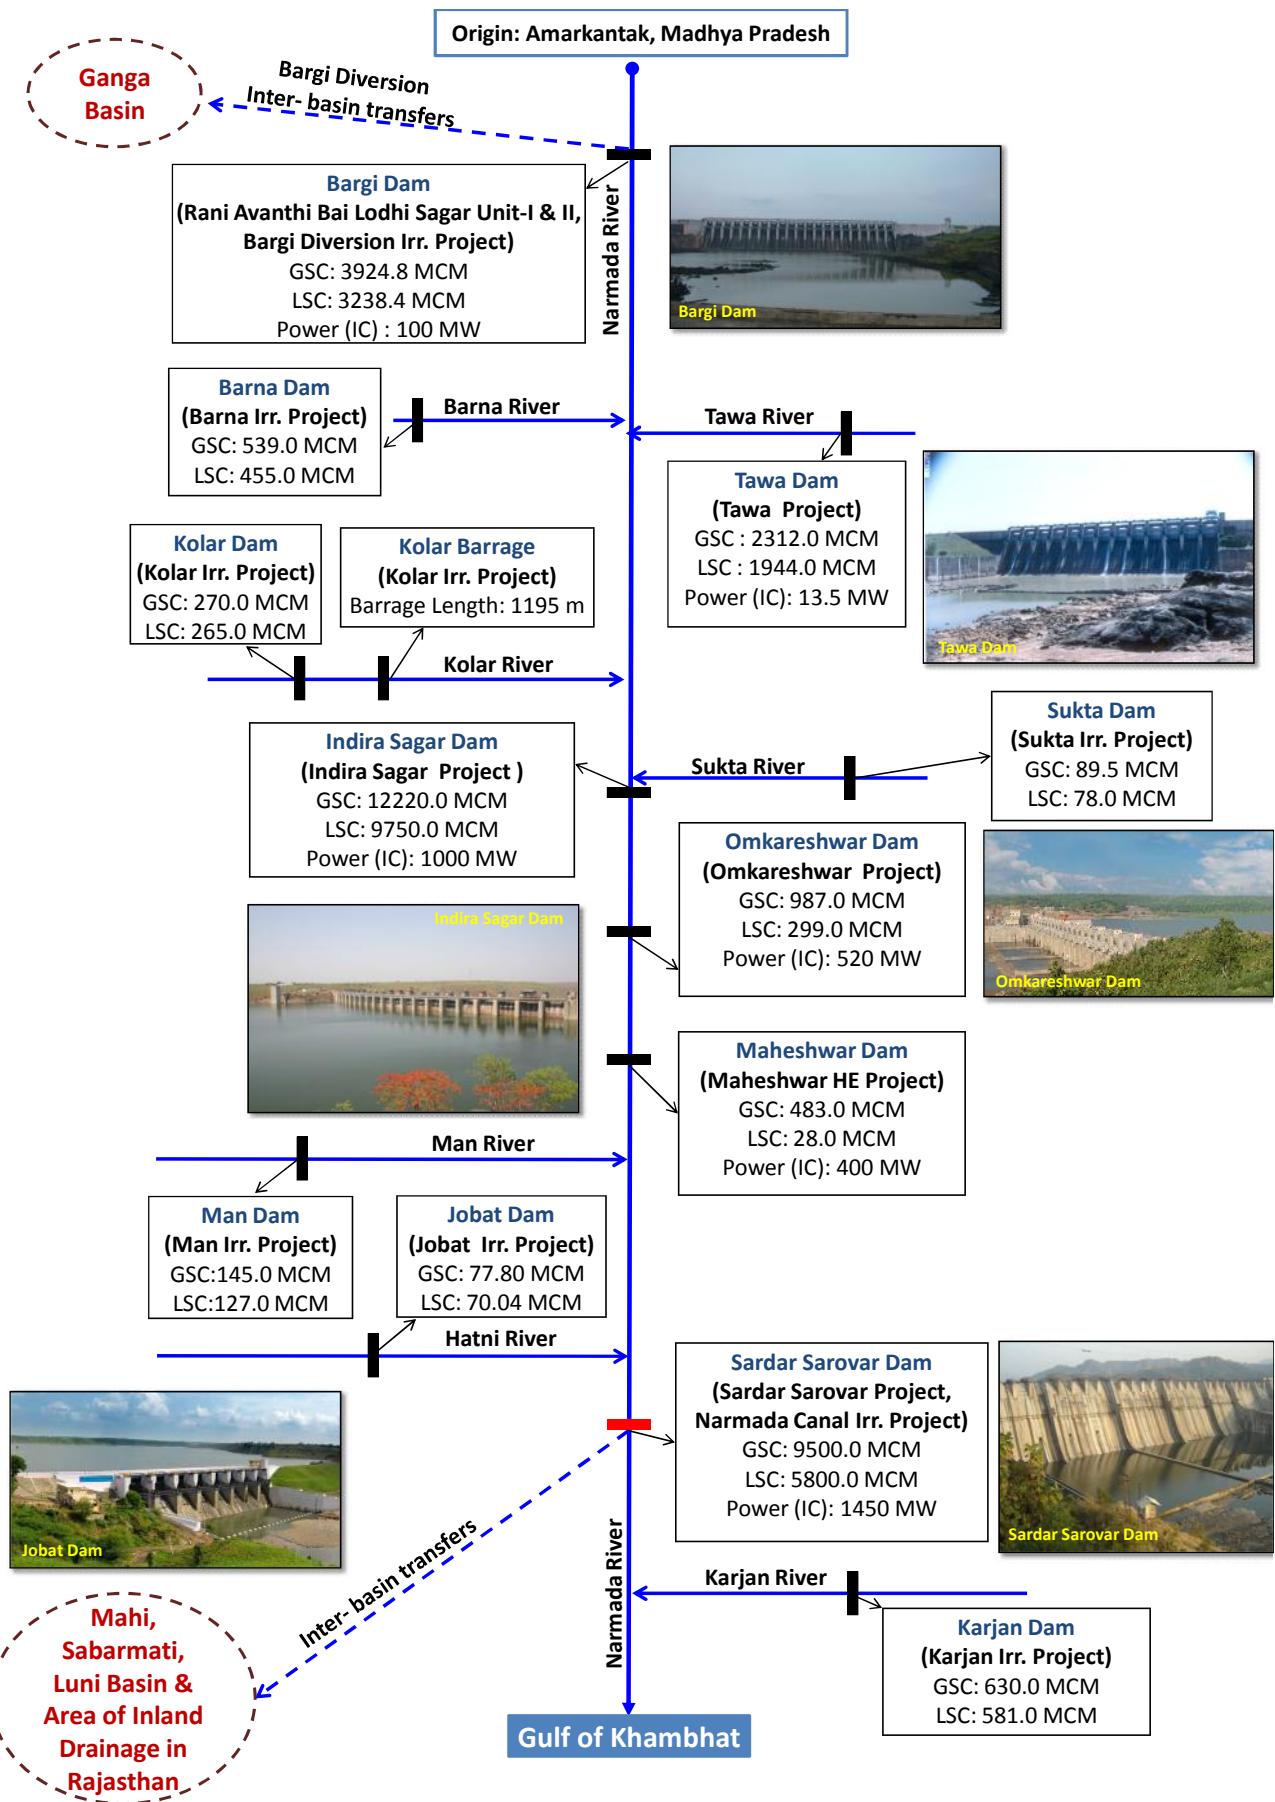

2.10.3 Peak Water Level: This basin contains 19 sites and has interesting fact that Dindori site which is situated at highest latitude and longitude registered the highest peak water level of the order of 669.64 metre on 23.08.1991 during the reference period 2014-15.

2.10.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for four sites of Narmada basin (Fig 2.10.1 to Fig 2.10.12).

Narmada River Flow Line Diagram

2.10.6 Urban Centres: Jabalpur town is the main city in this basin. The second largest urban pocket in the Narmada Basin is Bharuch of Gujarat. Other urbanized centers are Khandawa of Madhya Pradesh.

2.10.7 Industries: There are few large scale and medium scale industries in the area. But as compared with other basins, industrialization is thin in this area.

2.10.8 Minerals: Important minerals found in the basin are Bauxite, Clay, coal, dolomite, graphite, iron ore, manganese, talc & limestone, etc.

2.11 TAPI BASIN

Location: The Tapi River is the second largest westward draining interstate river basin. It covers a large area in the State of Maharashtra besides areas in the states of Madhya Pradesh and Gujarat. The Tapi Basin is the northern-most basin of the Deccan plateau and is situated between latitudes $20^{\circ} 05' N$ to $22^{\circ} 03' N$ and longitudes of $72^{\circ} 38' E$ and $78^{\circ} 17' E$. The Satpura range forms its northern boundary whereas the Ajanta and Satmala hills form its southern extremity. Mahadeo hills form its eastern boundary. The basin finds its outlet in the Arabian Sea in the west. Bounded on the three sides by the hill ranges, the river Tapi, along with its tributaries, more or less flows over the plains of Vidarbha, Khandesh and Gujarat. The Tapi River drains an area of 65,145 sq km out of which nearly 80 percent lies in Maharashtra state.

The Tapi River originates near Multai in Betul district at an elevation of 752 metre above m.s.l. The total length of this west flowing river from its origin to its out fall into the sea is 724 km. For the first 282 km the river flows in Madhya Pradesh, out of which 54 km forms the common boundary with Maharashtra State. It flows for 228 km in Maharashtra before entering Gujarat. Traversing a length of 214 km in Gujarat, the Tapi River joins Arabian Sea in the Gulf of Cambay after flowing past the Surat city. The river receives tidal influence for a length of about 20 km upstream from the mouth.

The Tapi River receives several tributaries on both the banks. There are 14 major tributaries having a length more than 50 km. On the right bank, 4 tributaries namely the Vaki, Gomai, Arunavati and Aner join the Tapi River. On the left bank, 10 important tributaries namely the Nesu, Arunavati, Buray, Panjhra, Bori, Girna, Waghur, Purna, Mona and Sipna drain into the main channel. The drainage system on the left bank of the Tapi river is, therefore, more extensive as compared to the right bank area.

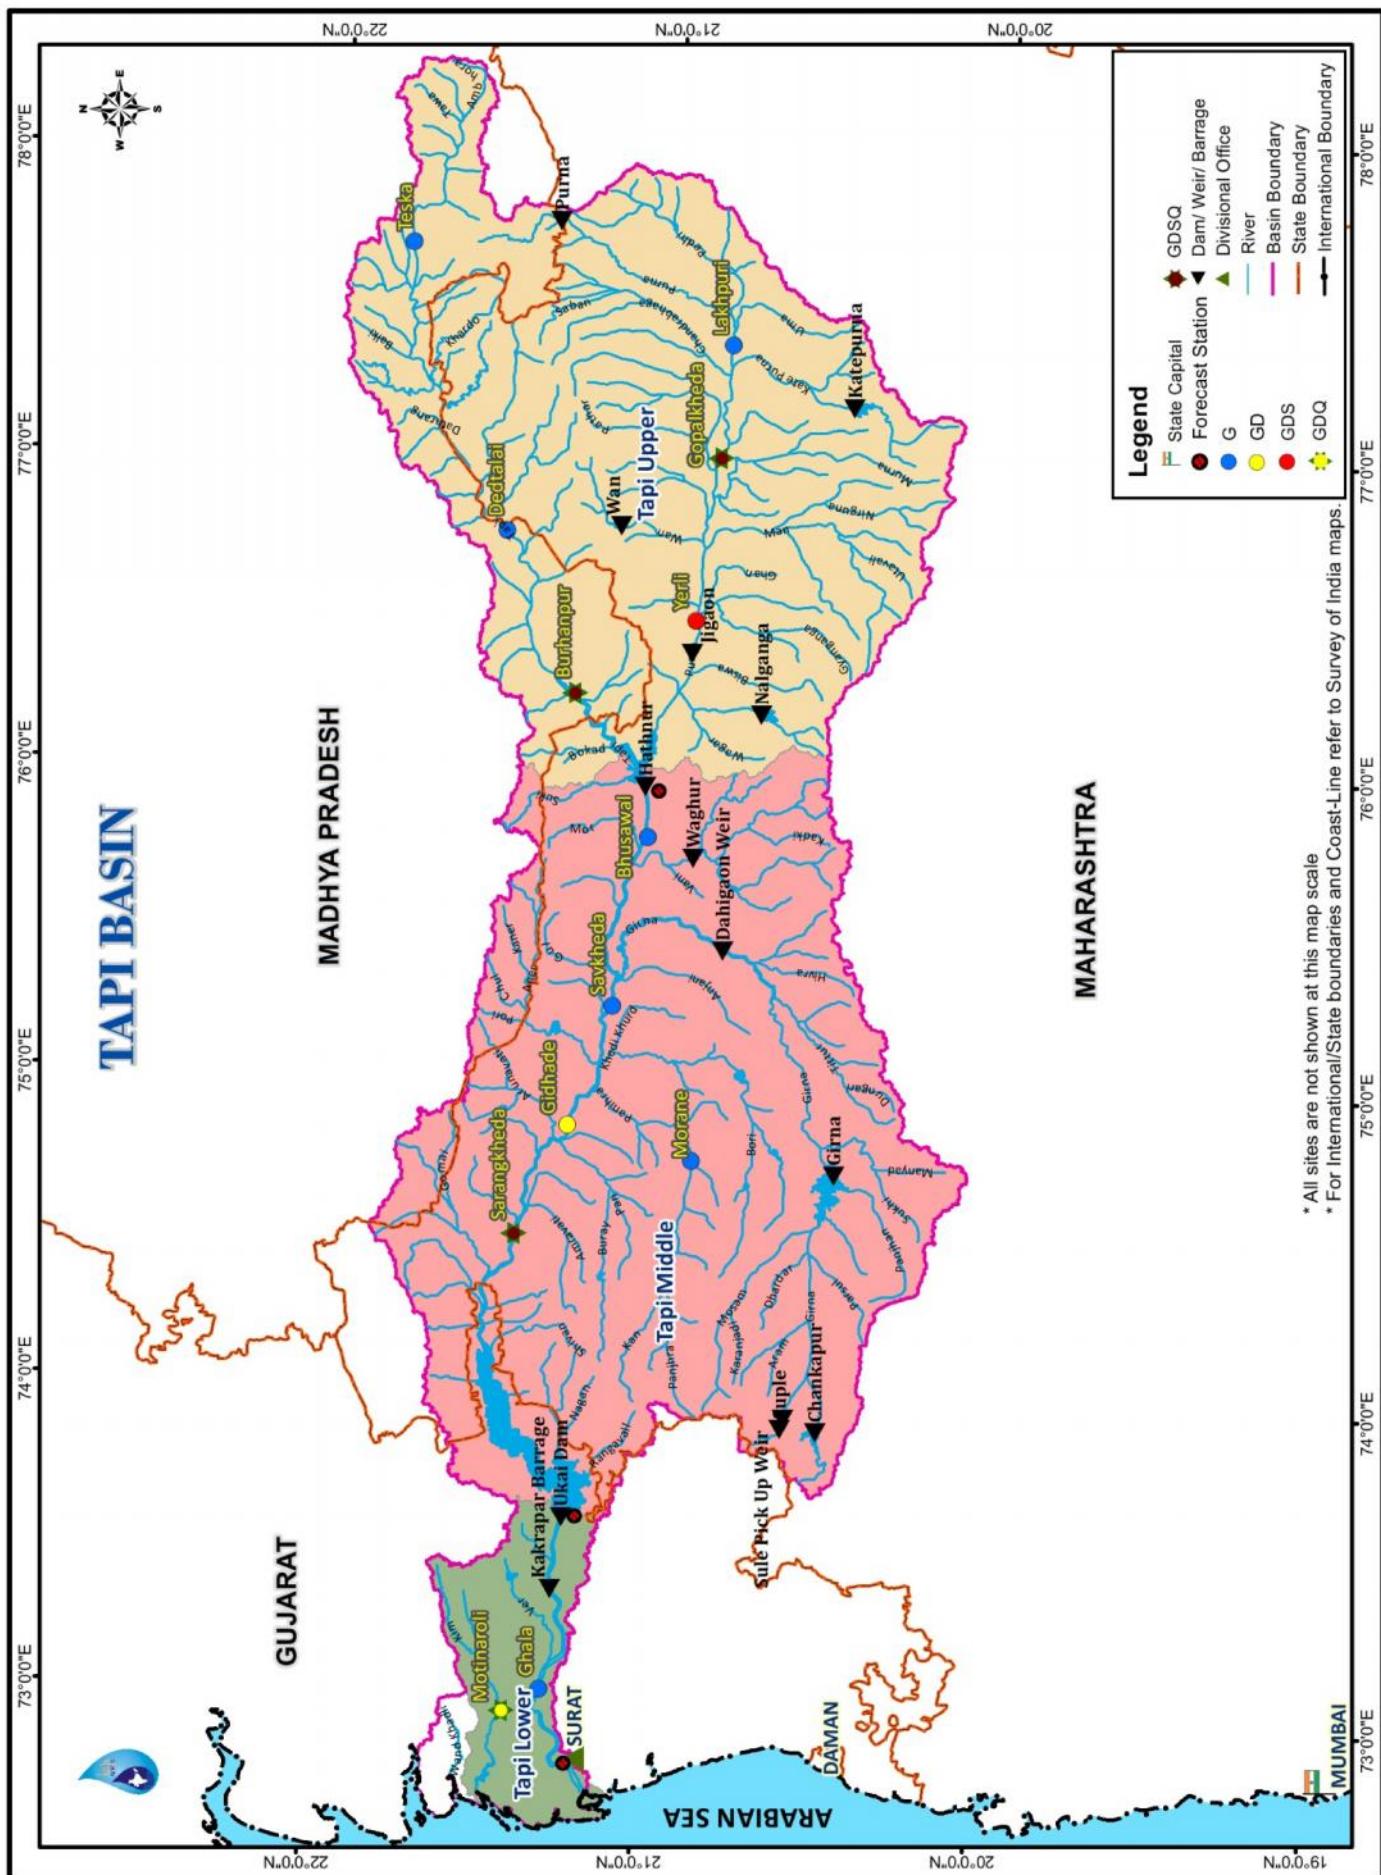

The Purna and the Girna, the two important left bank tributaries together account for nearly 45 percent of the total catchment area of the Tapi River. The Purna is the principal tributary of the Tapi River originating in Betul district in Gawilgarh hills of the Satpura range, mostly drains the three districts Amravati, Akola and Buldhana of Vidarbha Region. The Girna, another major tributary, rises in the Western Ghats and drains Nasik and Jalgaon districts of Maharashtra. The south-west monsoon sets in by the middle of June and withdraws by mid October. About 90% of total rainfall is received during the monsoon months, of which 50% is received during July and August.

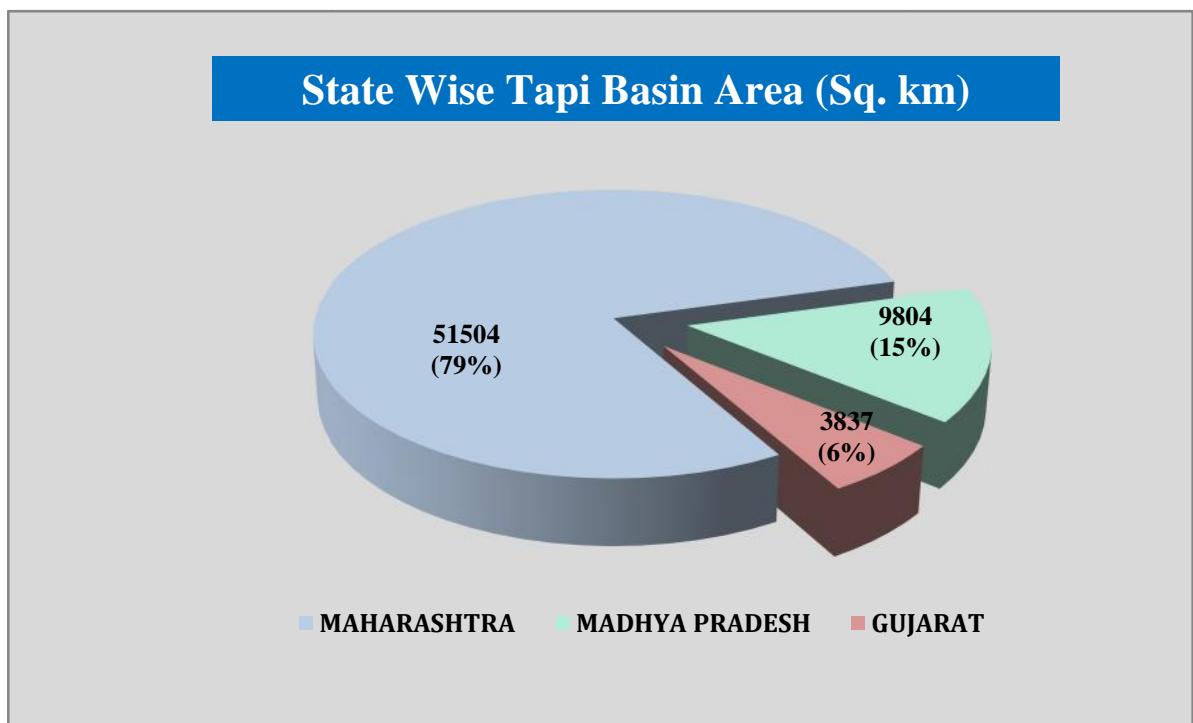

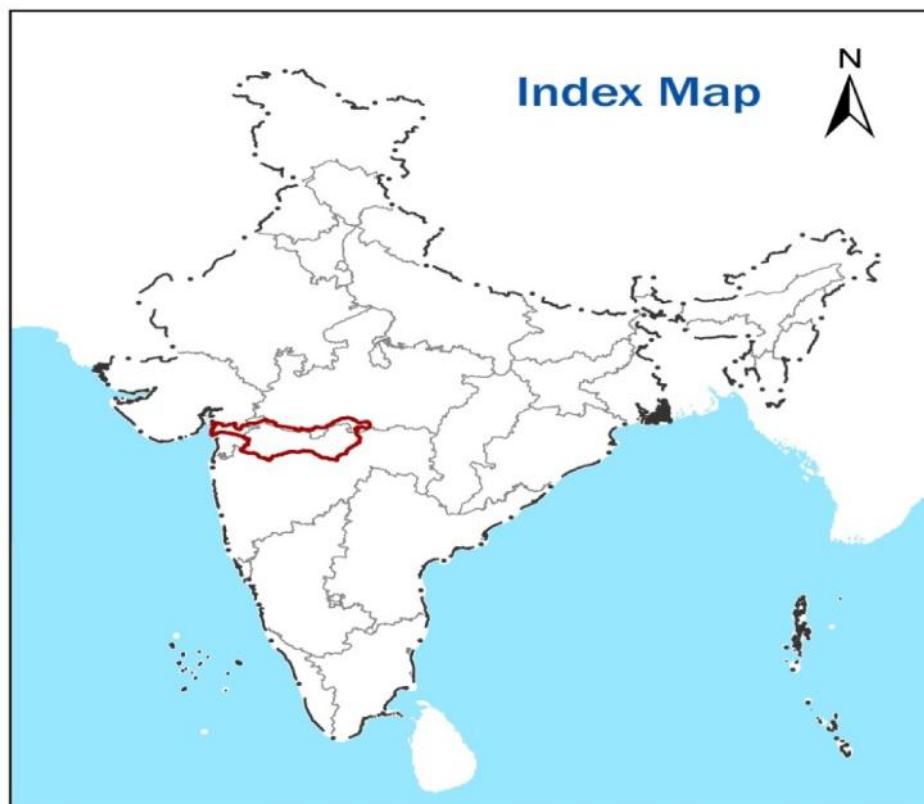

2.11.1 Irrigation Projects: The Ukai Dam, Kate Purna, Nalganga, Girna and Kakrapar Weir are the major projects in the catchment areas of the river basin.

2.11.2 Hydrological Observation Sites: There are 19 stations in total in the basin out of which 4 sites are for Water Quality along with gauge(18), discharge(6) and Sedimentation observations(4) (as per 2014-15 data).

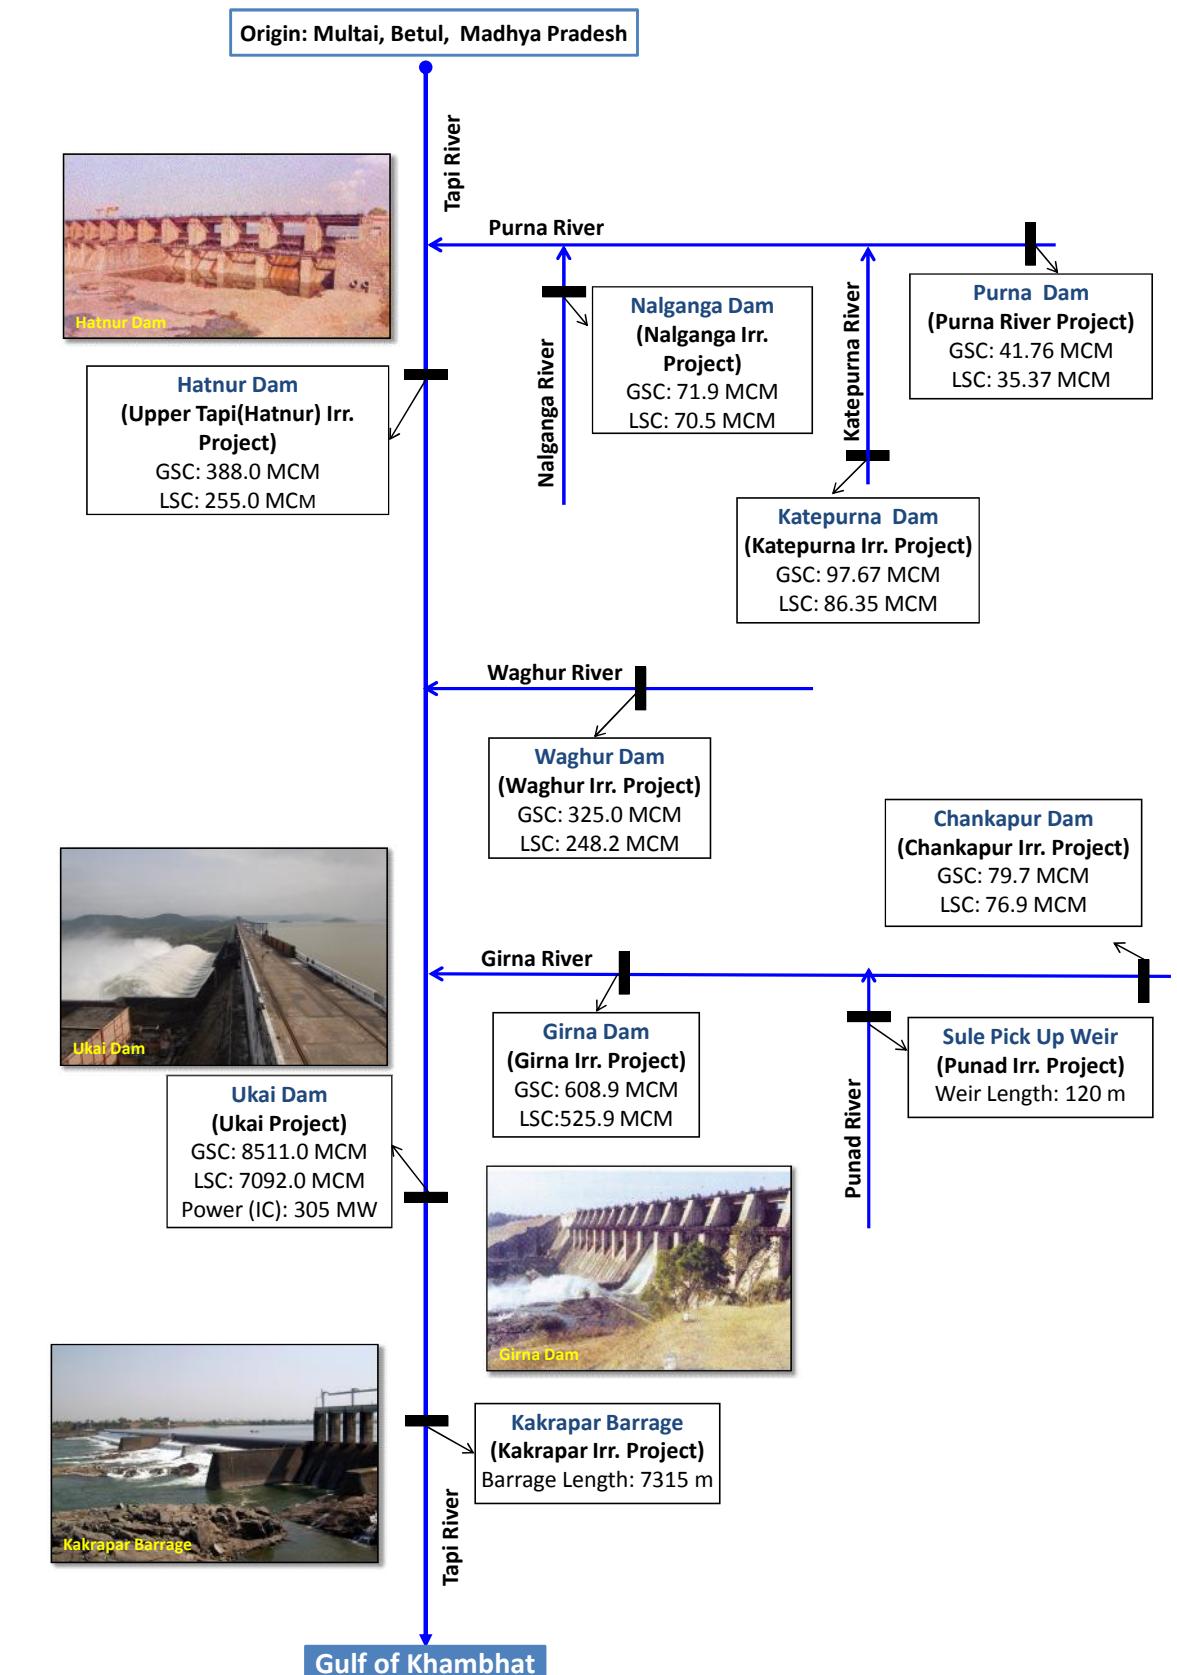

2.11.3 Peak Water Level: Tapi basin has reported only 6 sites, out of which Gopalkheda has the maximum peak water level at 252.1 metre during the reference period 2014-15.

2.11.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD are given below for two sites of Tapi basin (Fig 2.11.1 to Fig 2.11.2).

2.11.6 Urban Centres: Surat is the most important city in the area. Other cities are Amravati, Akola, and Jalgaon.

2.11.7 Industries: Important industries in the basin are Paper Mills and Sugar Mills. Other industries are Cotton Spinning Mills, Dal, Oil and Wood cutting Mills.

2.12 WEST FLOWING RIVERS FROM TAPI TO TADRI BASIN

Location: The basin of West flowing rivers consists of all small independent river basins of peninsular India lying to the south of Krishna basin, except Cauvery basin draining into Arabian Sea. There are about 31 major and minor rivers basins in this region.

The basin of the West Flowing Rivers located in the South West corner of the peninsular India covers areas in the states of Maharashtra, Karnataka, Tamilnadu and Kerala. There are a number of medium and minor river basins in this region. All the rivers originate from the high mountains of the Western Ghats and exhibit similar characteristics. They have steep high banks, which rarely overflow or cause floods. Important west flowing river sub-basins are described as under.

2.12.1 Ulhas: The Ulhas River is one of the West Flowing rivers in Maharashtra falling into the Arabian Sea. The boundary of the basin consists of the main Sahyadri hills on the east, western off shoots on the north and south and on the west, a narrow opening at the end leading to the sea. The Ulhas basin lies between north latitudes of $18^{\circ} 44'$ to $19^{\circ} 42'$ and east longitudes of $72^{\circ} 45'$ to $73^{\circ} 48'$. The Ulhas drains an area of 4,637 sq km and lies completely in Maharashtra. The Thane, Raigad and Pune districts fall in the basin. The Ulhas rises from Sahyadri hill ranges in the Raigad district of Maharashtra at an elevation of 600m above msl. The total length of the Ulhas from its origin to its outfall in to the Arabian Sea is 122 km. The basin receives most of the rainfall from South-West monsoon during June to October. The important tributaries of the Ulhas River are Pej, Bhalla, Barvi, Salpe and Bhivapuri. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.12.2 Kal: The Kal River is a major tributary to river Savitri originates from the Sahyadri hill ranges in the Raigad district of Maharashtra. It drains an area of 670 Sq.Km which lies completely in Raigad district. The total length of this river from its origin to its confluence with the Savitri is 40 Km. Water quality station on this river is established at **Mangaon**, where water quality observations are being carried out from 02.07.1993.

2.12.3 Kajvi: The Kajvi River rises in the Vishalghat region of Sahyadri hills and flows West ward and joins the Arabian Sea near Ratnagiri port where a 10 km long creak named Bhatya Creak has been formed. During monsoon, tidal effect is felt up to village Hercheri that is about 25 km. from the mouth of river. The nature of Bed is sandy mixed with gravels. The H.O. site is at Anjanari village in Lanja Taluk of Ratnagiri District of Maharashtra State.

2.12.4 Gad: The Gad originates from the Sahyadri hill ranges in the Sindhudurg district of Maharashtra state. It drains an area of 890 Sq.Km and has a length of 66 Km from its origin to its out fall into the Arabian Sea. The only water quality on this basin at Adavali has been shifted to **Beline Bridge** in June 2000.

2.12.5 Mandovi: The Mandovi River is one of the main West Flowing Rivers of Goa State. The Mandovi Basin lies between north latitudes of $15^{\circ} 15'$ to $15^{\circ} 40'$ and east longitudes of $73^{\circ} 15'$ to $73^{\circ} 45'$ approximately. There are two CWC Hydrological Observation Stations located at Ganjam & Collem. The Mandovi River drains an area of 1,550 sq km. The Mandovi River rises in the Jamboti Ghats in Karnataka State. At the origin, near the village Mabulyesheir, it is known as Bhaburnal, which is at an elevation of 600m above M.S.L. The total length of this West Flowing River is 62 km. The important tributaries are Sarang, Mahainada, Udel, Lohi, and Khandepar. The average rainfall in the Mandovi Basin is 3,484 mm. The lowest and

highest temperatures recorded are 9.30° C during January 1937 and 42.6° C during March 1959 respectively.

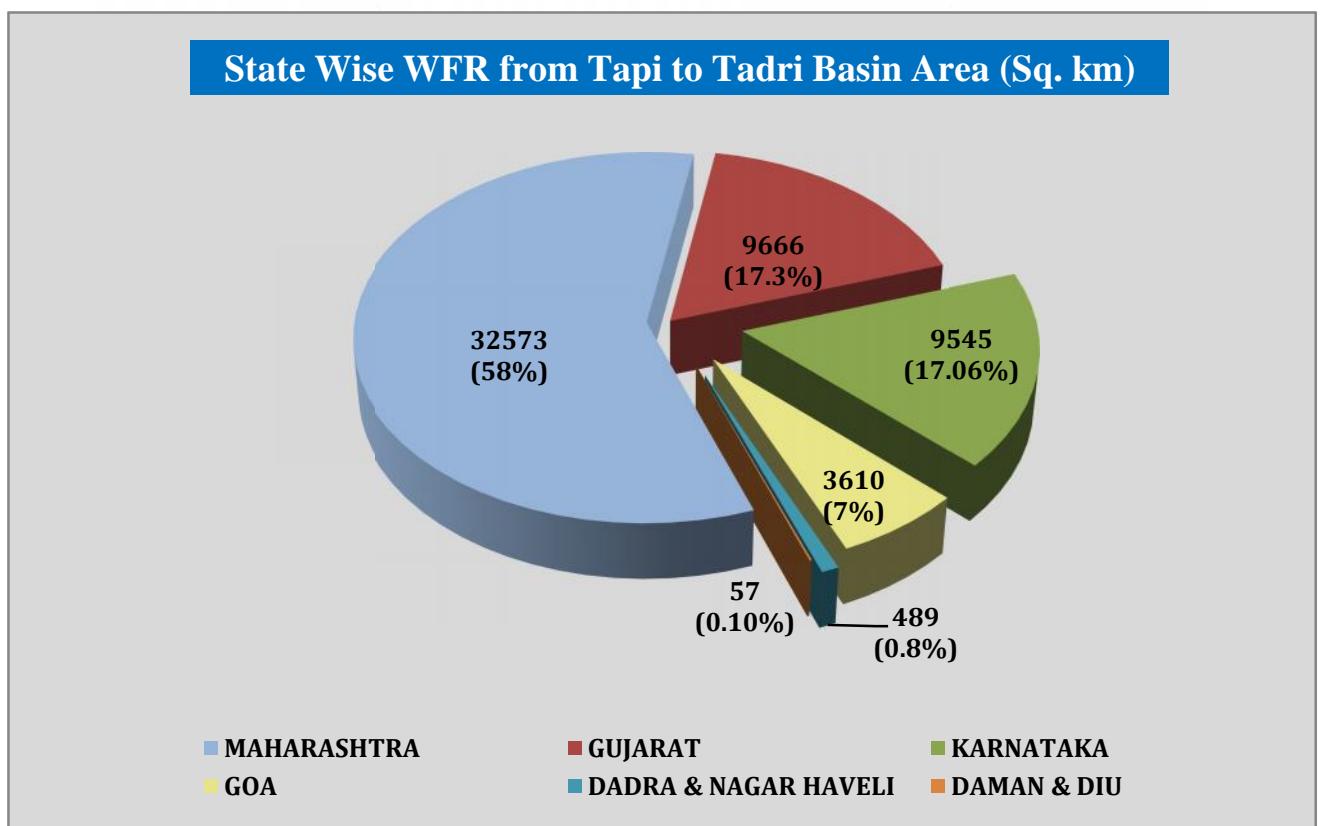

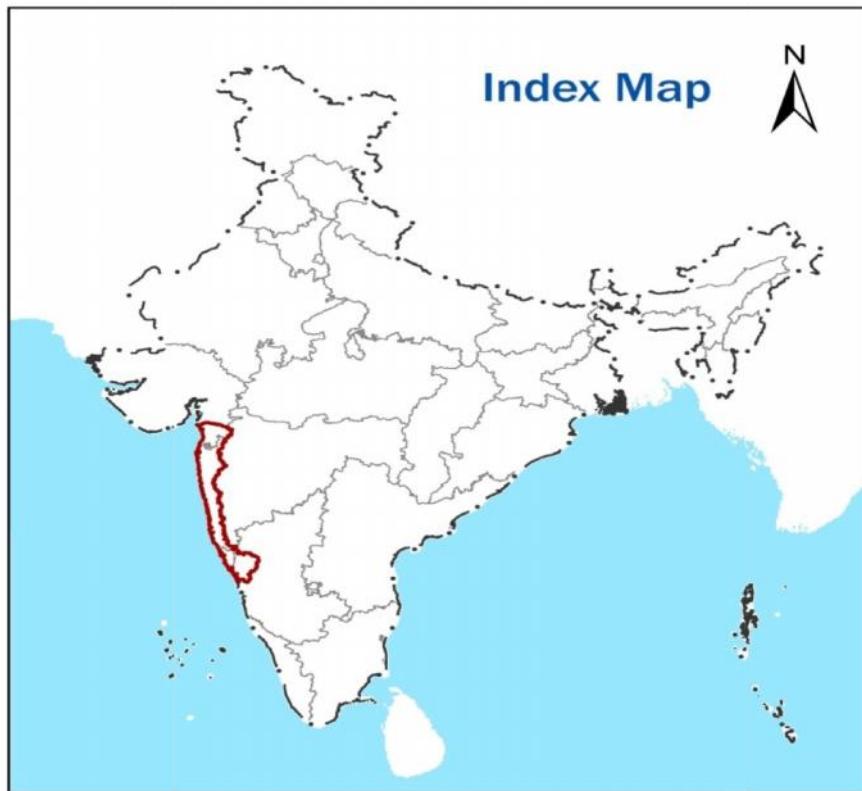

2.12.6 Aghanashini: The River Aghanashini originates from Gadihalli in the Western Ghats of Karnataka. The river has a catchment area of 1350 Sq.Km. and its total length is 117 Km. The river flows mostly through forest area and the only water quality station on this river is at *Santeguli*. Water Quality Monitoring of this basin commenced with the introduction of Water Quality observations at Santeguli with effect from 01.09.1993.

2.12.7 Irrigation Projects: The Anjunem in the sub-basin of Mandovi, Kal in the sub-basin of Kal, Swarna Dam in the sub-basin of Swarna, Kattampally in the sub-basin of Valapatanam, Malampuzha Reservoir, Tirumurthi and Aliayar in the sub-basin of Bharathapuzha, Chalakudi River Diversion Scheme, Sholayar H.E.S and Peringalkuthu Left Bank Scheme in the sub-basin of Chalakudi, Periyarvalley Project, Edamalayar and Idukky Hydel Project in the sub-basin of Periyar, Pamba Hydel Project in the sub-basin of Pamba, Kalada Irrigation Project in the sub-basin of Kalada are the major projects in the catchment areas of the west flowing river basin.

2.12.8 Hydrological Observation Sites: There are 37 sites in the basin for recording observations on water quality, gauge and discharge and sedimentation. Sediment observations are made at 22 of these stations (as per 2014-15 data).

2.12.9 Peak Water Level: This basin has reported information in respect of 9 sites during the reference period 2014-15. The peak water level of the sites remains in two digits for all sites. At Collem site, the peak water level touched at 71.55 metre on 10.08.2008.

2.13 WEST FLOWING RIVERS FROM TADRI TO KANYAKUMARI BASIN

Location: The basin extends over states of Kerala, Karnataka, Tamil Nadu and Union Territory of Puducherry having an area of 56,177 Sq. km, which is 1.73 % of total geographical area of the country with a maximum length and width of 777 km and 135 km respectively. It spreads between 74°25' to 77°36' east longitudes and 8°3' to 14°24' north latitudes. The basin is bounded by Sahyadri hills on the north, by the Western Ghats on the east, by Indian Ocean on the south and by the Arabian Sea on the west. The basin is comprised of three sub-basins; *Netravati and Others sub basin*, *Periyar and others sub basin* and *Varrar and others sub basin*.

The major independent rivers in the basin are the *Varahi*, *Netravati*, *Payaswani*, *Valapattanam*, *Chaliyar*, *Kadalundi*, *Bharathapuzha*, *Periyar*, *Muvattupula*, *Minachil*, *Pamba*, *Achankovil*, *Kallada* and *Vamanapuram*.

The major part of basin is covered with agriculture land accounting to 50.82% of the total area while 34.72% is covered by Forest. The salient features for the basin are described in Table 2.

Brief descriptions of the rivers are given below.

2.13.1 Haladi: This river Haladi originates in the Western Ghats near Someswara in the reserved forest of Karnataka. The river has a drainage area of 781 Sq.Km and a total length of 70 Km. The water quality station on this river is at **Haladi**, where water quality observation commenced from 01.09.1993.

2.13.2 Swarna: This river Swarna is one of the major west flowing rivers in Dakshina Kannada district. Total drainage area of this river up to the site is 327 Sq.Km. and the river flows for a distance of 61.05 Km up to its confluence with sea. The river is called Yennehole in the initial stages and Swarna after its confluence with its tributary Kaud-hole. The water quality station on this river is established at **Yennehole**, where water quality observations are being carried out from 01.09.1993.

2.13.3 Netravathi: The Netravathi rises between Kudermukh and Ballalaryan Durga in the Dakshina Kannada district of Karnataka at an elevation of about 1000 metre at 75° 20' East longitude and 30° 10' North latitude flows generally in north-south direction for 40 km up to Gohattu, where it takes a turn towards the west and flow in east-west direction practically up to its outfall into the Arabian Sea near Mangalore. The climate of the basin is characterized by heavy rainfall, high humidity and oppressive weather in hot season. The hot season from March to May is followed by the South West monsoon from June to September. The Kumaradhara, a major left-bank tributary joins it near the village Uppinangadi. The total length of the Netravathi is 103 km from its source to the outfall. The river drains an area of 3,657 sq km. No major project is in existence in this basin. However, the investigations for the project titled multi-purpose Netravathi Anicut Scheme have been completed. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.4 Payaswani: The Payaswani, also known as the Chandragiri in the lower reaches, originates from the Patti Ghat reserve forest in Coorg District of Karnataka. The river covers a distance of 105 Kms. and drains an area of 1538 Sq. kms. The only water quality station on this basin is located at **Erinjipuzha**, where Water Quality observation commenced from 01.07.1988.

2.13.5 Valapatanam: The Valapatanam river rises south of Ammatti village in the district of Coorg in Karnataka State at $75^{\circ} 52'$ east longitude $12^{\circ} 13'$ north latitude at an elevation of 900m above msl. The river has a total length of 101 km from its source to its fall into the Arabian Sea. The river drains an area of 1,867 sq km of which 546 sq km lies in Karnataka and rest in Kerala. The climate of this basin is characterized by heavy rainfall, high humidity and oppressive weather in hot season. The Kattampally multipurpose project is the main irrigation Projects in this basin. The Kattampally project has been planned in two stages. The stage I will not only prevent saline water intrusion and reduction of flood but also provide irrigation benefits to an area of 1,280 ha. The second stage of the project is expected to irrigate an additional area of 1,650 hectares. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.6 Chaliyar: The Chaliyar, known in the lower reaches as the Beypore, is one of the major rivers of Kerala. The main river starts from the Elambalari hills at an altitude of 2,067m above msl. It is formed by the confluence of numerous streams and rivers. Its important tributaries are the Cherupuzha, The Iringipuzha, the Vadapurampuzha and the Chaliyarpuzha. The Chaliyar flowing for a total length of about 169 km and finally joins the Arabian Sea at Beypore. The river drains a total area of about 2,933 sq km of which 2545 sq. Km lies in Kerala and 388 sq. Km in Tamilnadu. Good rainfall and humid temperature throughout the year are the characteristic of the basin. The climate along the coastal area of the basin is generally hot with high humidity. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.7 Kadalundi: The Kadalundi river originates from Karuvakkundu village in the Calicut District of Kerala State. It drains a total area of 1,112 Sq.kms. and traverses about 130 Kms. Water Quality station on this basin is located at **Karathodu** only, where Water Quality observation commenced from 01.12.1988.

2.13.8 Bharathapuzha: The Bharathapuzha River is the second longest west flowing river that drains into the Arabian Sea in Kerala State. This basin is bounded in the east by the Cauvery basin and in the west by the Arabian Sea. The basin lies approximately between $10^{\circ} 26'$ and $11^{\circ} 13'$ north latitudes and $75^{\circ} 53'$ to $77^{\circ} 13'$ east longitudes. Its drainage area is spread in Tamilnadu and Kerala states. The basin is elongated in shape and finds its outlet into the Arabian Sea. The total drainage area of the basin is 6,186 sq km out of which nearly 71 percent lies in the Kerala State. The Bharathapuzha basin receives copious rainfall during the south west monsoon and it falls in the rain shed region of the Western Ghats. There are five H.O. sites for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.9 Chalakudi: The Chalakudi River has its origin in the Annamalai hills of Western Ghats. It is formed by the confluence of five streams namely the Parambikulam, the Kuriarkutty, the Sholayar, the Karappara and the Anakayam. The river has a length of 130 km. The total drainage area of the river is 1,704 sq km of which 1404 sq. Km lies in kerala and the rest in Tamil Nadu. Good rainfall and humid atmosphere are felt throughout the year. The climate along the coastal area of this basin is generally hot with high humidity. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.10 Periyar: The Periyar River is 244 km in length and the longest river of Kerala and drains an area of 5,398 sq km. It rises at the forest land Sivagiri peak 80 km south of Devikulam at an elevation of 2,438m above msl and traverses the steep mountainous terrain before it is joined by the Mullaiyar, 16 km downstream. The river then turns west and continues to flow in the direction for about 16 km in a sandy bed. After a winding course of

about 13 km, the river reaches Vandiperiyar and passes through a second narrow gorge below which the Perumthura joins it. Further down, it is joined by six tributaries of which the important tributary Edmala joins the Periyar. Passing Malayattur and thereafter taking a meandering course, the river reaches Alwaye where it divides itself into two branches. The upper branch joins the Chalakudi River at Punthenvelikara and then expands into a broad sheet of water at Munambham. The other branch taking a southerly course is broken up into a number of small channels, which fall into the Vembanad Lake as Varapuzha. There are 2 Gauge, 2 Discharge, 2 water quality and one sedimentation type of H.O. sites.

2.13.11 Muvattupuzha: River Muvattupuzha originates in the Kottayam district of Kerala. It is a perennial river with total drainage area 1554 Sq.kms and the length is 121 kms. There are two water quality stations on this Basin, one on the main river Muvattupuzha at *Ramamangalam* and the other at *Kalampur* on its tributary called Kaliyar.

2.13.12 Meenachil: River Meenachil originates in Kottayam district of Kerala State. The total length of the river from its origin to Vembanad Lake, where it joins is about 78 kms. The drainage area is 1272 Sq.Kms. The only water quality station on this river is at *Kidangoor*, where water quality observation commenced from 02.06.1986.

2.13.13 Pamba: The Pamba, 176 km in length, is the third longest river in Kerala. It is formed by the confluence of the Pamba Aar, Kaki Aar, Arudhai Aar, Kakkad Aar and Kall Aar. The Pamba Aar rises in the Peermedu Plateau at an elevation of 1,670m. The Kaki Aar, which forms the major tributary of the Pamba River, is a much larger stream at the beginning than the main river. The Pamba River, after receiving the Kaki Aar, flows in a Westerly direction till the Arudhai Aar joins it. At Narayanamuzhi, it turns and follows a south-eastern direction until the Kakkad Aar joins it. Beyond the confluence, the river flows in a southerly direction up to Vadasserikkara where it is joined by the Kall Aar, which has its origin in the Valanjakkatti Malai. The catchment area of the river is 2,235 sq km. At Pandanad, the river bifurcates and one branch taking a western course. The Manimala joins the Pamba in its Neeretupuram branch. The river thereafter flows northwards and falls into the Vembanad Lake through several branches. The basin experiences good rainfall, moderate temperature and humid atmosphere. The south west and north east monsoon have great influence over the climatic condition of the basin. There is one H.O. site for each of Gauge, Discharge, Sedimentation and Water Quality.

2.13.14 Achankovil: River Achenkovil originates in the south of Devarmalai, in the Quilon District of Kerala. The river is formed by several streams originating from Pasukidamettu, Ramakkla Teri and Rishi Malai. It has a total length of 128 km. and drains an area of 1484 Sq. Km. The drainage area up to the Site is 810 Sq. Km. The only water quality station on this basin is located at *Thumpamon*, where Water Quality observation commenced from 15.10.1978.

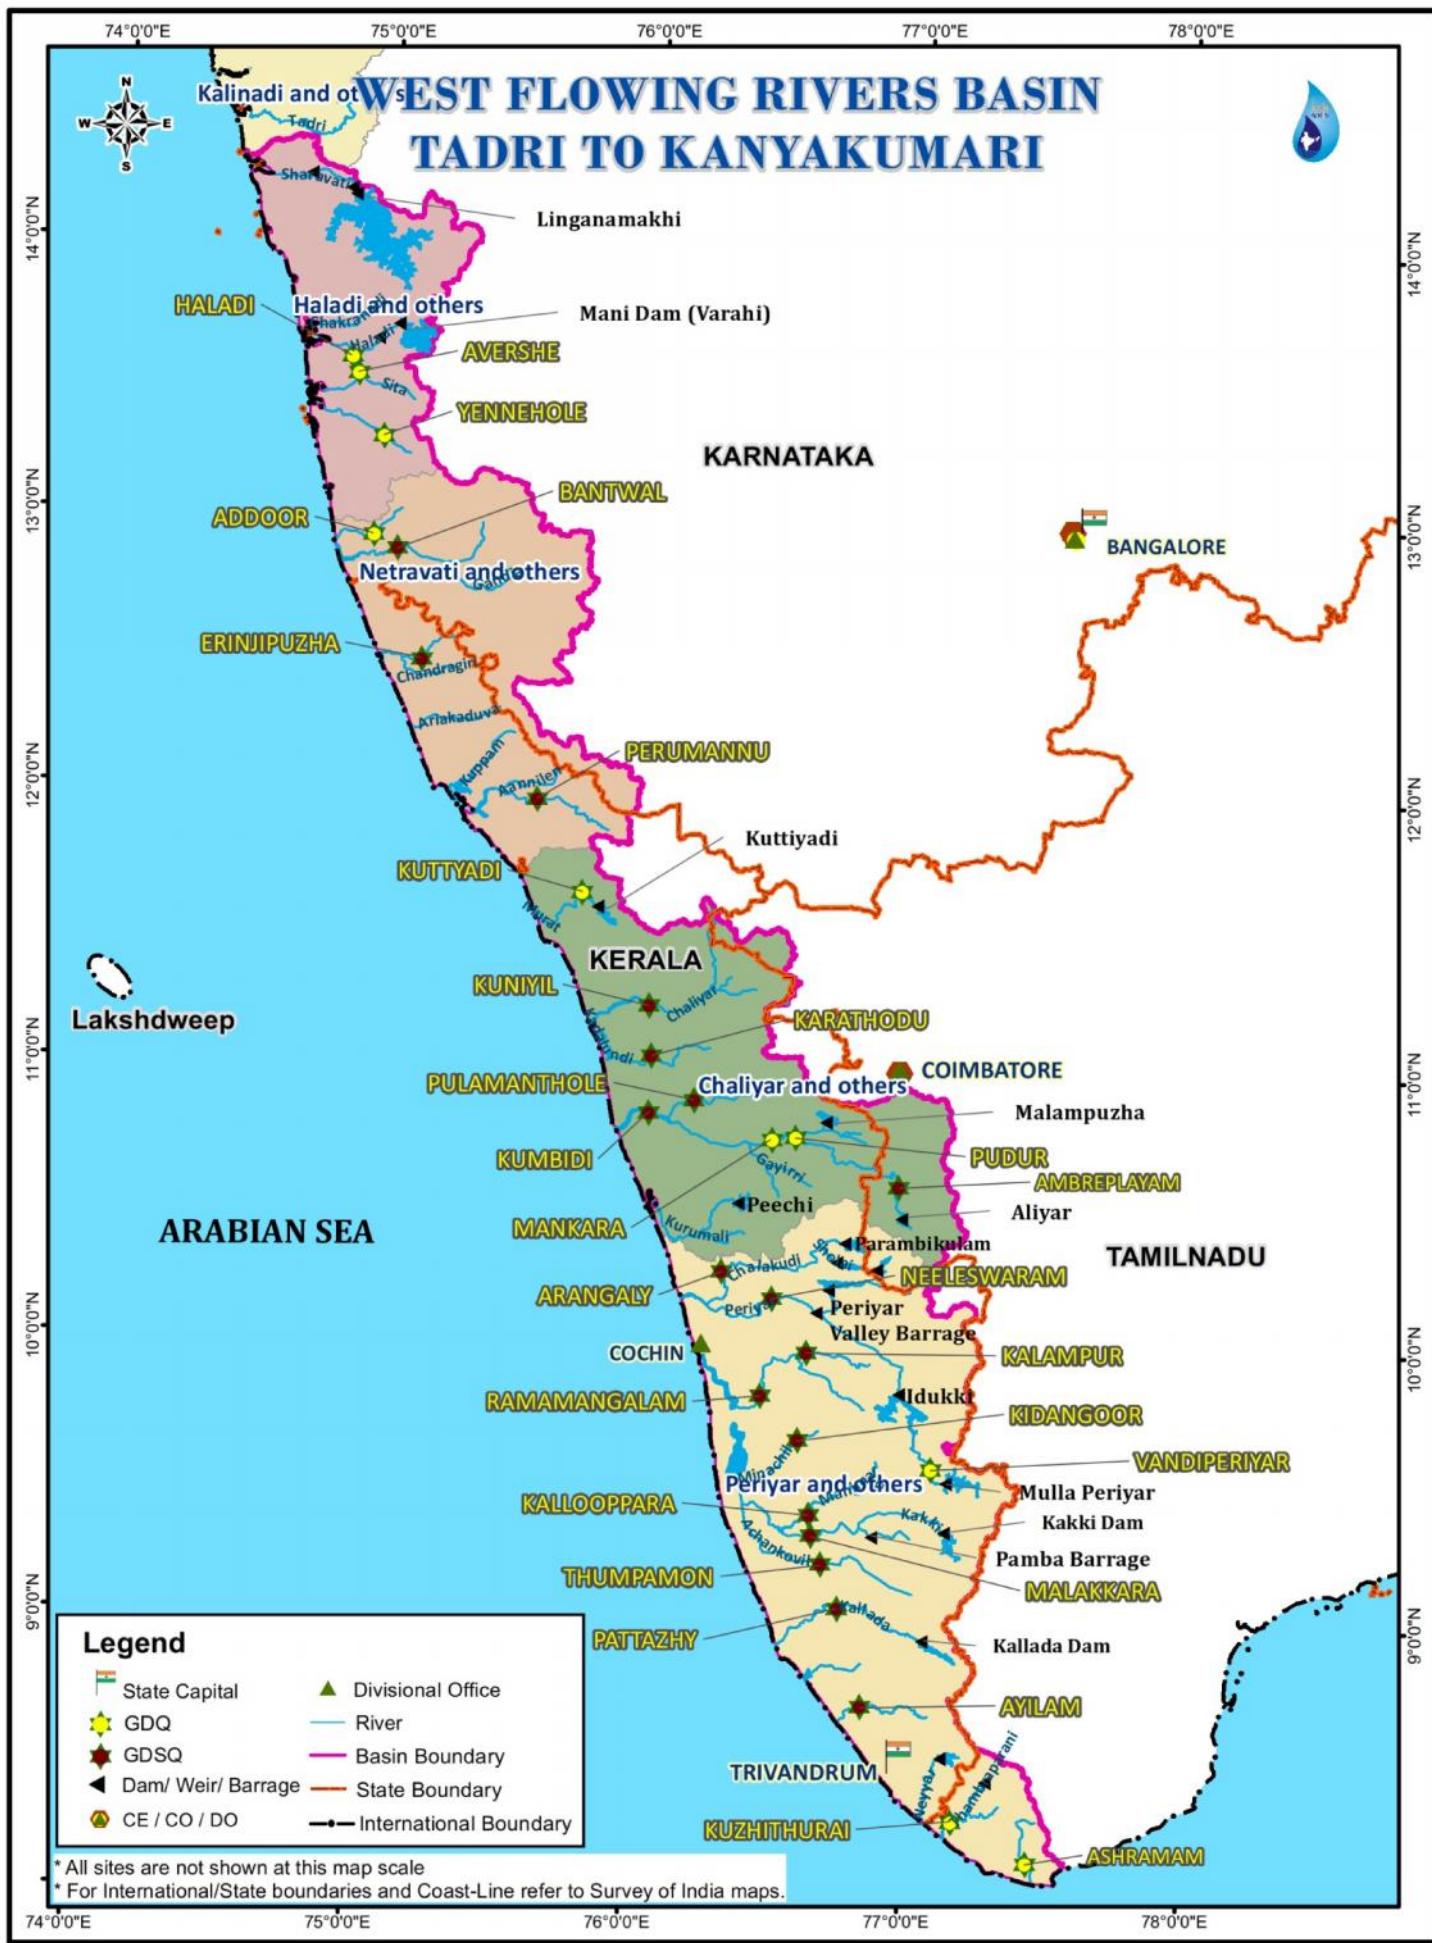

2.13.15 Kallada: The Kallada River is formed by the three rivers i.e. Kulathupuzha, Chendurni and Kalthuruthy joining together near Parappar. The river has its origin in Papanasam range south of Kulathupuzha in Quilon district of Kerala State at an altitude of 900m above msl. The river has a length of 121 km and drains an area of 1,699 sq km before confluence with the Ashtamudilake. The basin experiences good rainfall and humid atmosphere throughout the year. The climate along the coastal region of this basin is generally hot with high humidity.

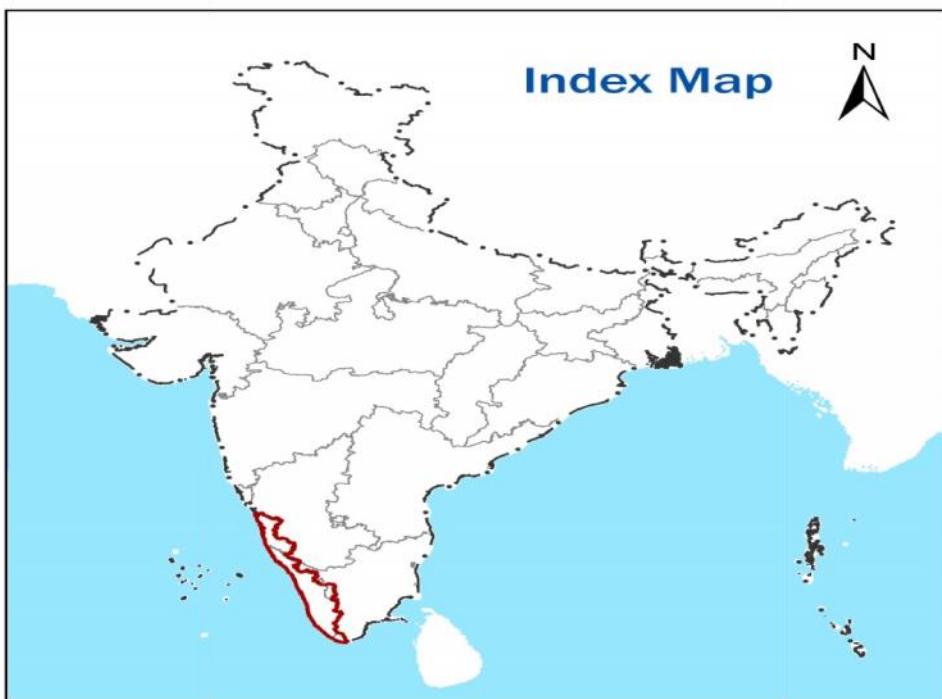

2.13.16 Vamanapuram: River Vamanapuram originates from Chemunji Motai in Kerala. Its total drainage area is 687 Sq.Kms and the length is 88 Kms. The only water quality station on this river is at *Ayilam*.

2.13.17 Irrigation Projects: The Anjunem in the sub-basin of Mandovi, Kal in the sub-basin of Kal, Swarna Dam in the sub-basin of Swarna, Kattampally in the sub-basin of Valapatanam, Malampuzha Reservoir, Tirumurthi and Aliayar in the sub-basin of Bharathapuzha, Chalakudi River Diversion Scheme, Sholayar H.E.S and Peringalkuthu Left Bank Scheme in the sub-basin of Chalakudi, Periyarvalley Project, Edamalayar and Idukky Hydel Project in the sub-basin of Periyar, Pamba Hydel Project in the sub-basin of Pamba, Kalada Irrigation Project in the sub-basin of Kalada are the major projects in the catchment areas of the west flowing river basin.

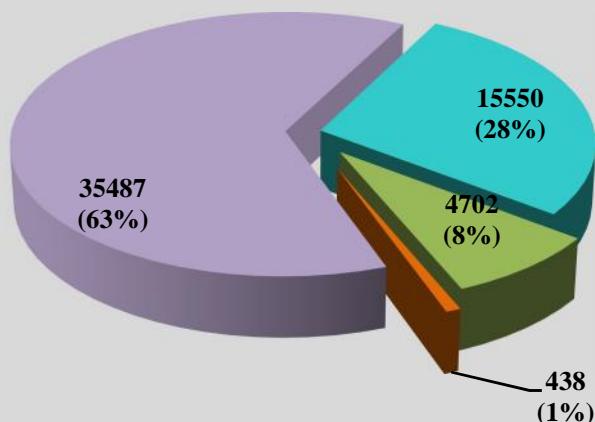

2.13.18 Hydrological Observation Sites: There are 28 sites in the basin for recording observations on water quality, gauge and discharge and sedimentation. Sediment observations are made at 18 of these stations (as per 2014-15 data).

2.13.19 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for two sites of the basin (Fig 2.13.1 to Fig 2.13.11).

2.14 MAHI BASIN

Location: The Mahi river is one of the major west flowing inter-state river of India, draining into the Gulf of Khambat. The basin is bounded on the North and the North - West by Aravalli hills, on the East by the ridge separating it from the Chambal Basin, on the South by the Vindhya range and on the West by the gulf of Khambat. The river Mahi originates on the Northern slope of Vindhya range near the village of Sardarpur in the Dhar District of Madhya Pradesh at an elevation of 500m above msl. Its length is 583 kms and it traverses through states of Madhya Pradesh, Rajasthan and Gujarat. The river Mahi drains an area of 34,842 sq km.

Initially the river flows Northwards through Dhar and Jhabua districts of M.P. and then turns left and passes through the Ratlam district of M.P., then turning to North - West, it enters the Banswara district of Rajasthan and flows in South-West directions and thereafter enters the Panchmahal district of Gujarat state. Then the river continues to flow in the same direction through Kheda district of Gujarat and finally falls into Gulf of Khambat in Arabian Sea. The Mahi Bajaj Sagar, Kadana Reservoir, Wanakbori Weir, Panam, Bhadar, Jakham and Somkamlamba are the major projects in the catchment areas of the Mahi sub-basin.

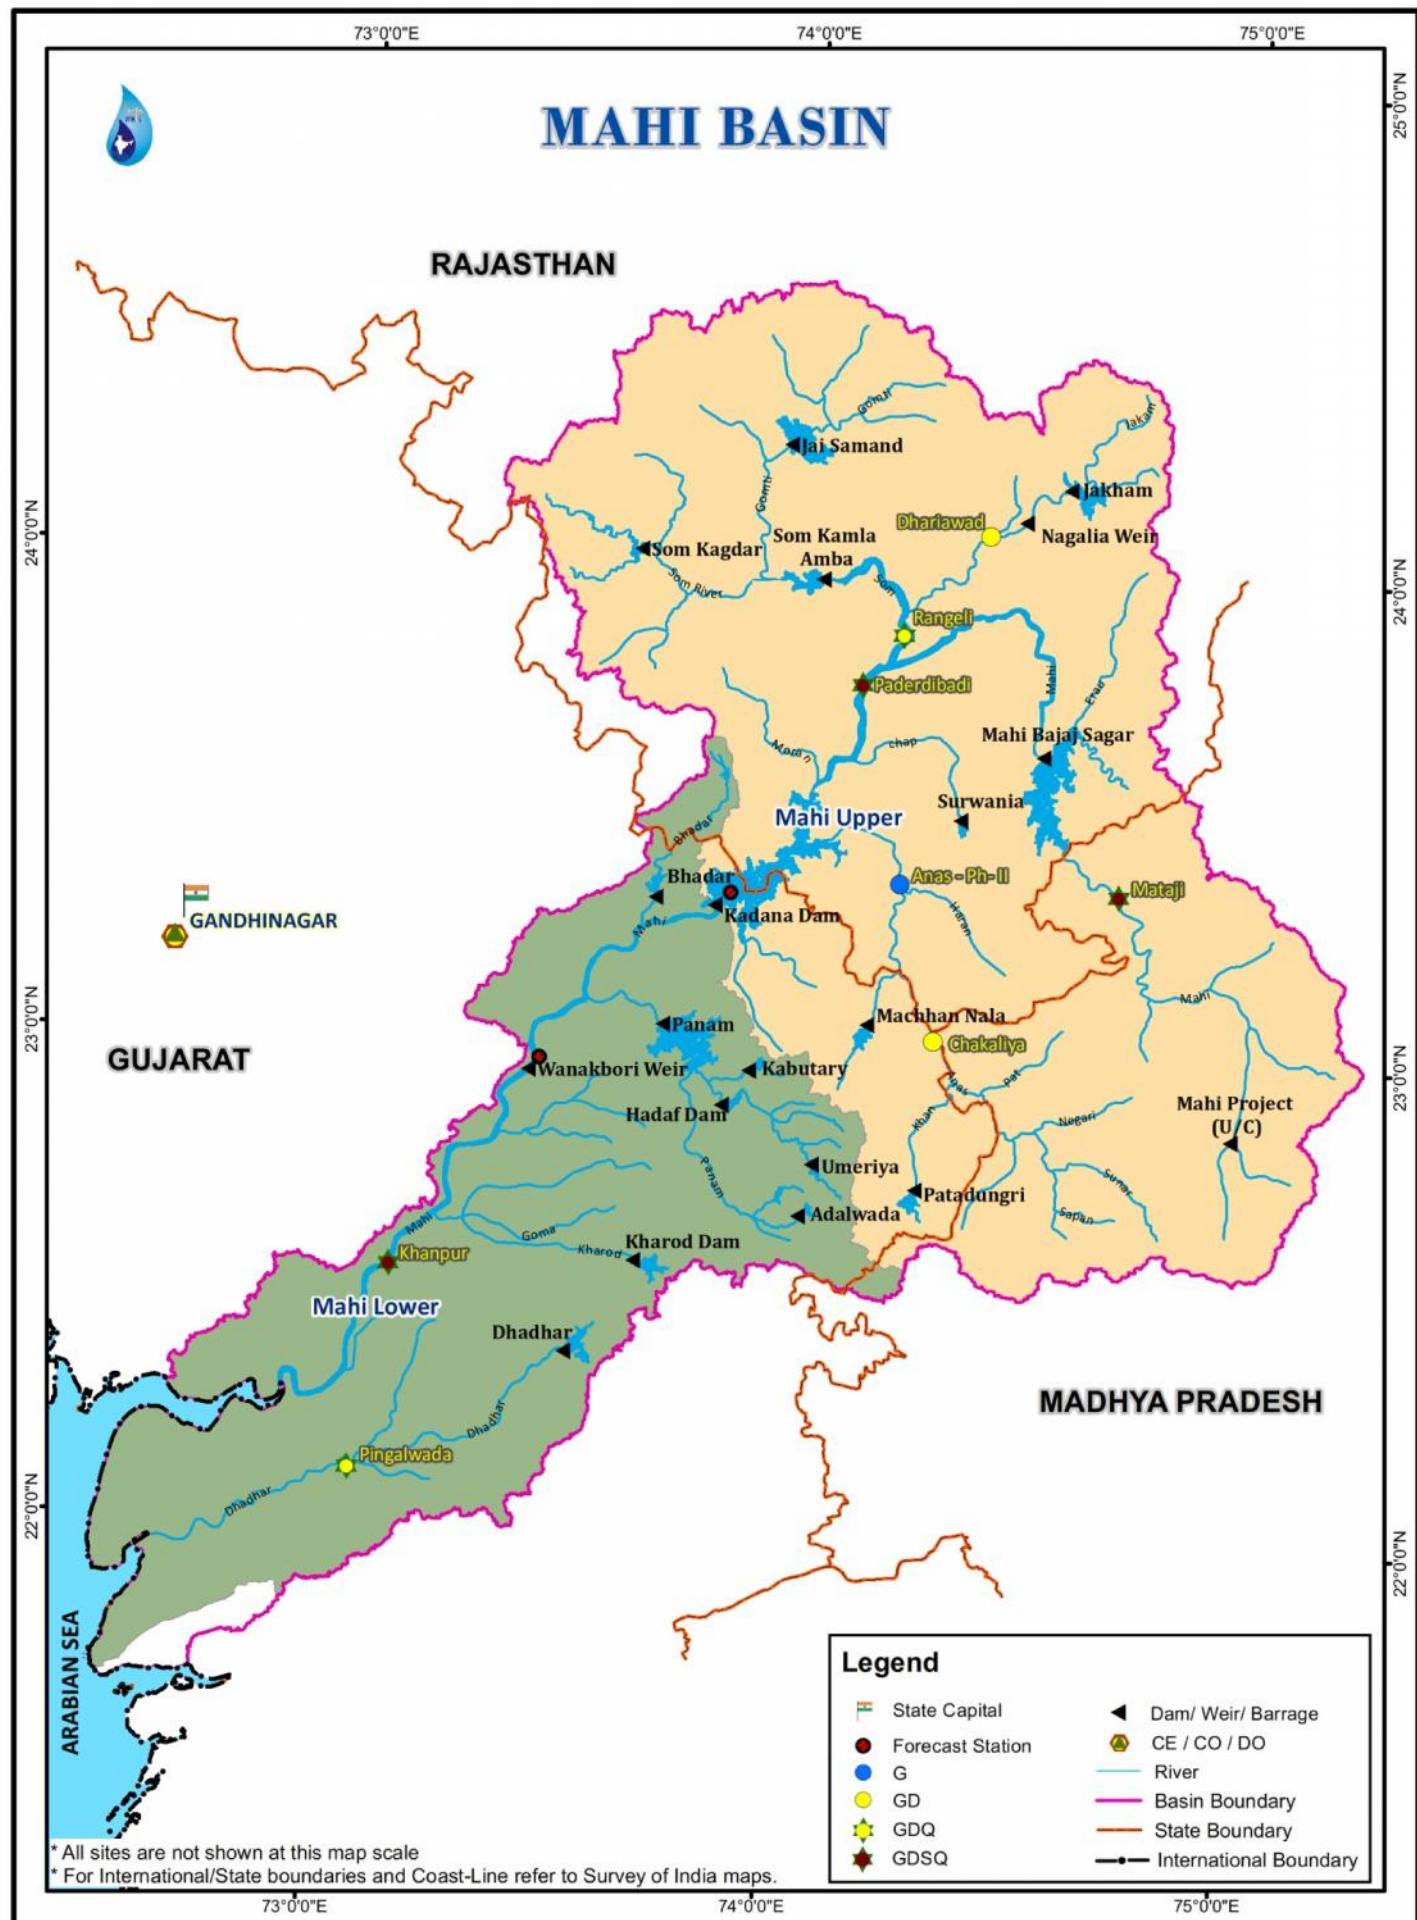

The basin contains two climatic regions, the northern part of the basin comprises sub tropical wet climate (generally basin area occupied by Rajasthan). The major part of the basin comprises tropical wet climate, caused mainly due to existence of Vindhya and the Western Ghats. The temperature of the basin varies from 3° to 47°C . The average rainfall in the Mahi basin is 785 mm.

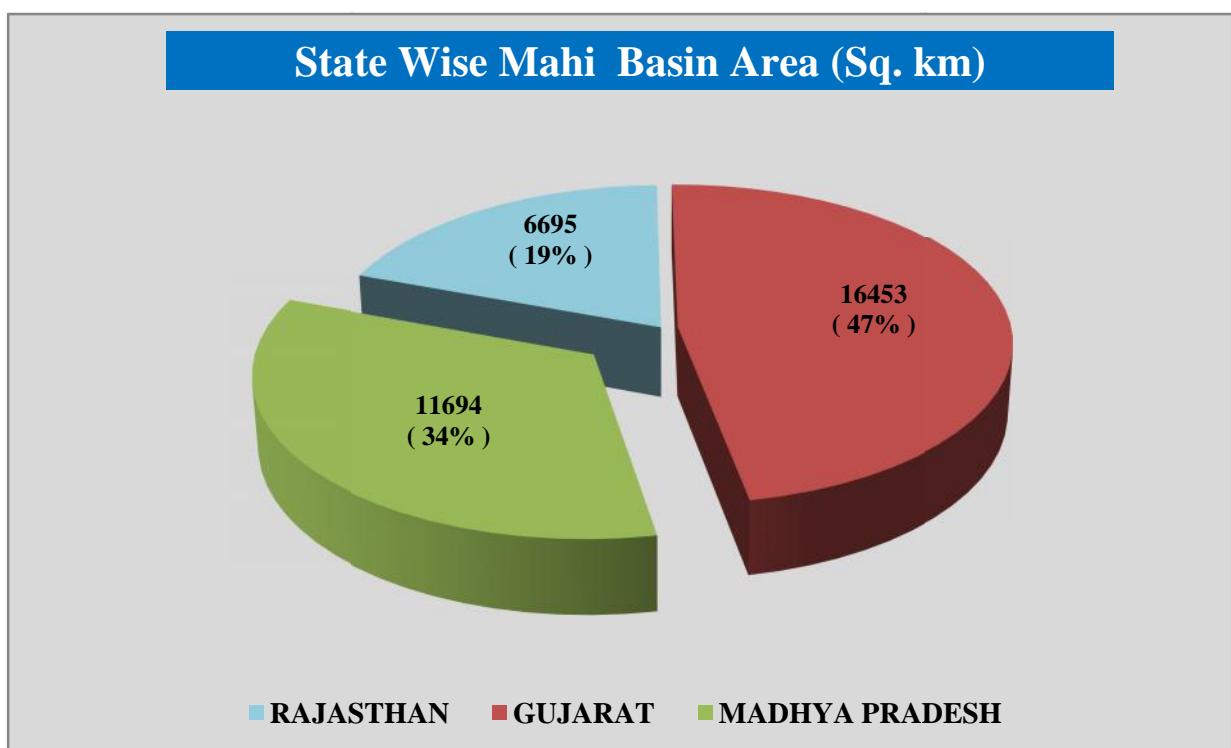

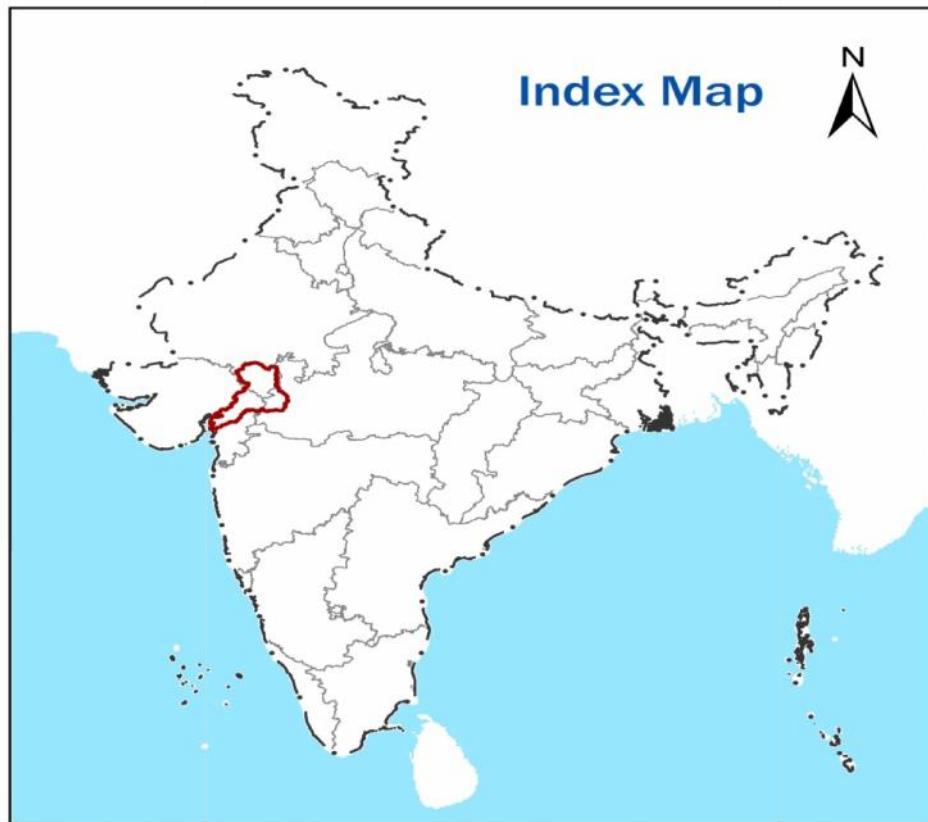

2.14.1 Irrigation Projects: Mahi Irrigation Project, Mahi Bajaj Sagar, Panam Dam, Jakham Dam are major irrigation projects in the basin.

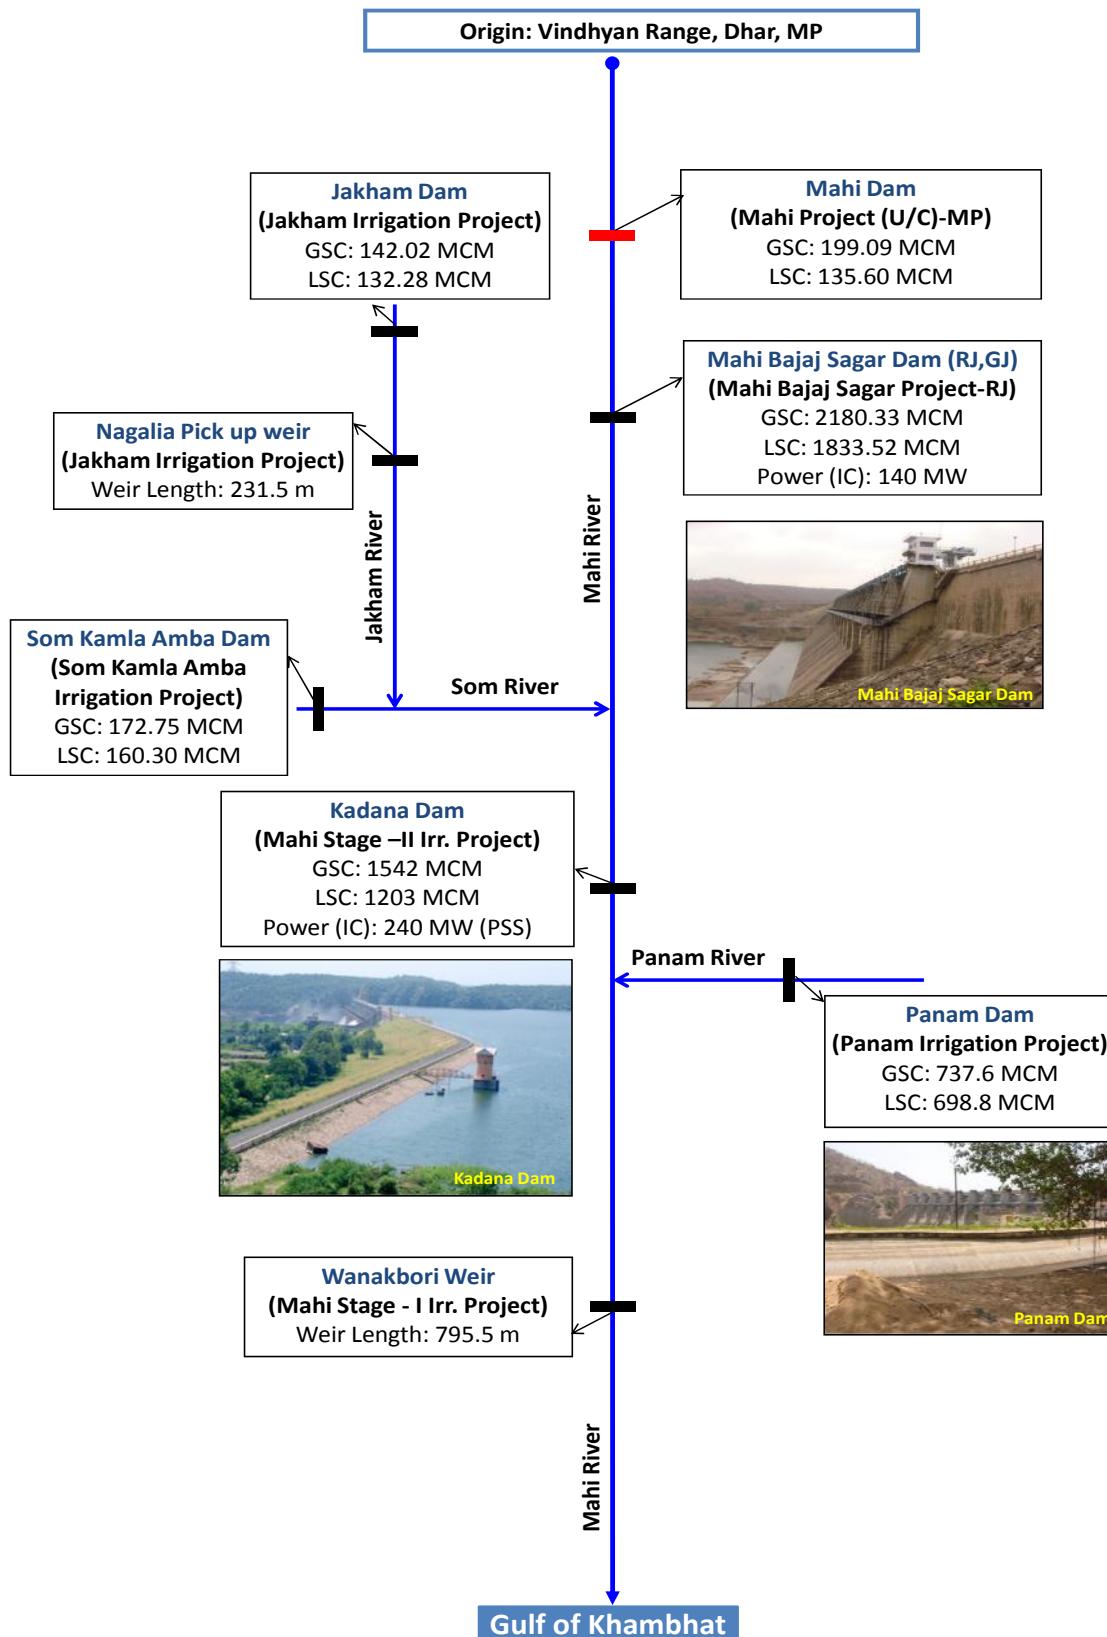

2.14.2 Hydrological Observation (H.O.) Sites: There are total 13 H.O. sites in the basin, out of which 6 sites for Gauge only, 2 sites for Gauge & Discharge, 2 sites for Gauge, Discharge, Water Quality and 3 sites for Gauge, Discharge, Sedimentation & Water Quality.

2.14.3 Peak Water Level: Khanpur, Mataji and Paderdibadi are the oldest sites out of the 6 sites reported in the basin, which were established in late 1970 to make the observations of Gauge/Discharge, Sediment and Water Quality. Mataji recorded the highest peak water level at 307 metre dated 04.10.1988 during the reference period 2014-15.

2.14.4 Water Quality: Temporal trends of water quality parameters viz. pH, BOD, DO, Total hardness are given below for three sites of Mahi basin (Fig 2.14.1 to Fig 2.14.12).

2.15 SABARMATI BASIN

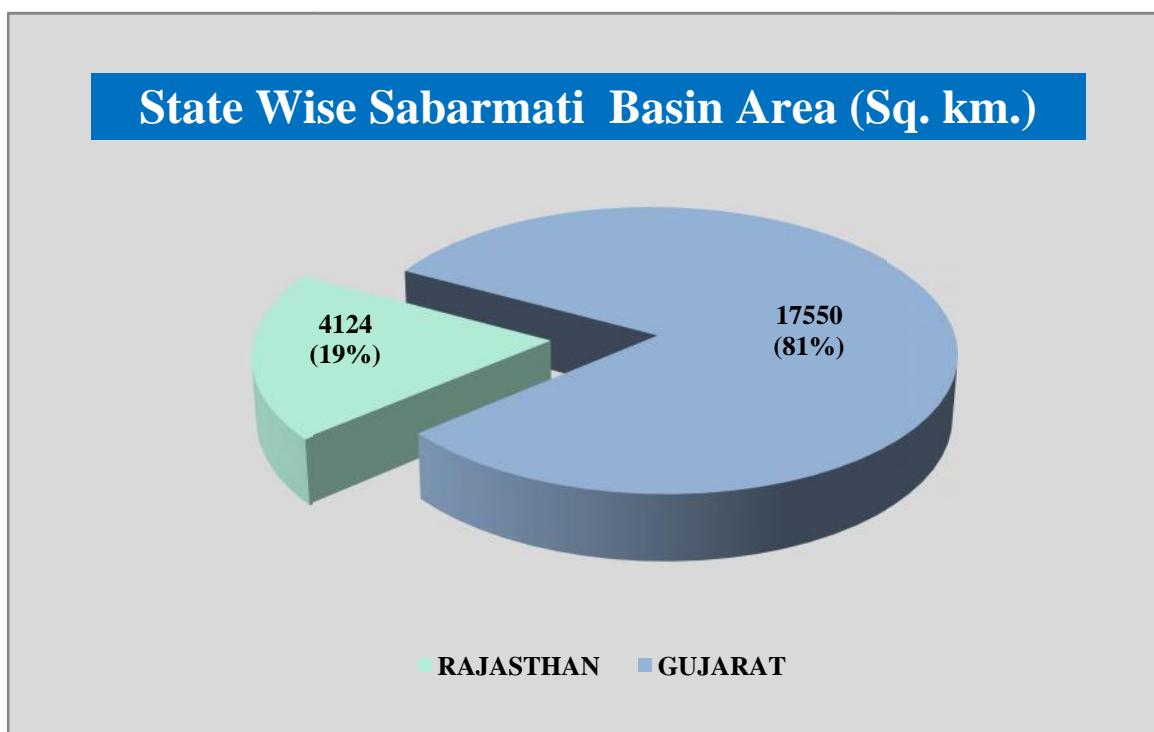

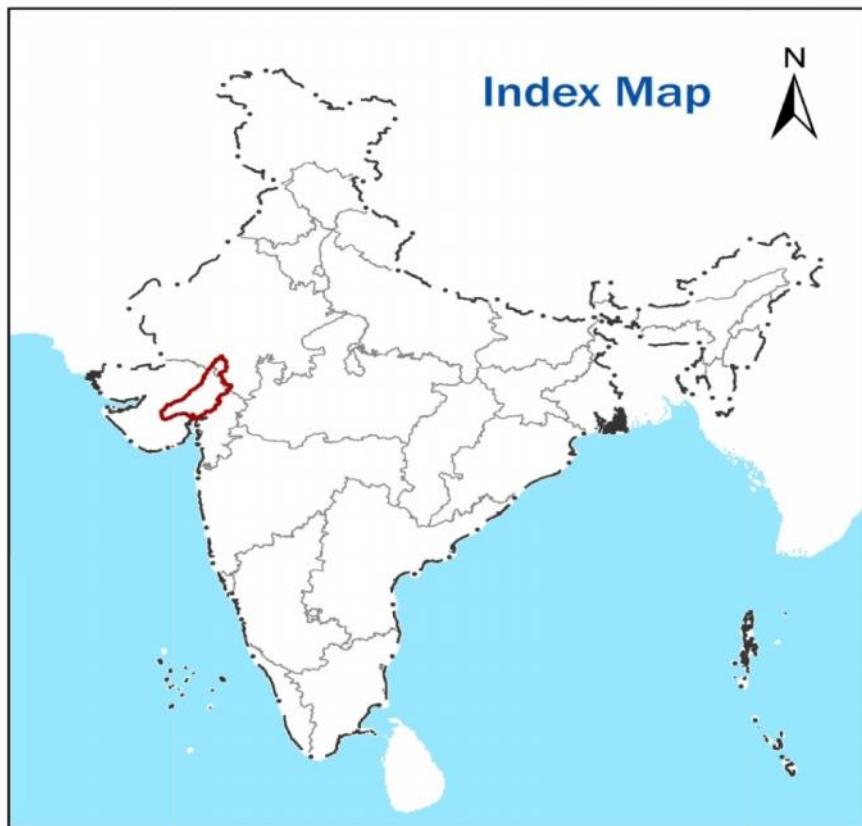

Location: The Sabarmati River is one of the major West flowing inter-state rivers in India, draining into the Gulf of Khambat. The basin is bounded by Aravalli hills in the North and North-east. The ridge separating it from basins of minor streams and draining into Rann of Kutchh and Gulf of Khambat in West and by Gulf of Khambat in South. It is triangular in shape with the main river as the base and the source of the Watrak as the apex point. It originates in the Aravalli hills in the Rajasthan State at an elevation of 762m above msl. The river Sabarmati drains an area of 21,674 sq km with a total length of 371 kms. It lies between $70^{\circ} 58'$ to $73^{\circ} 51'$ east longitudes and $22^{\circ} 15'$ to $24^{\circ} 47'$ north latitudes.

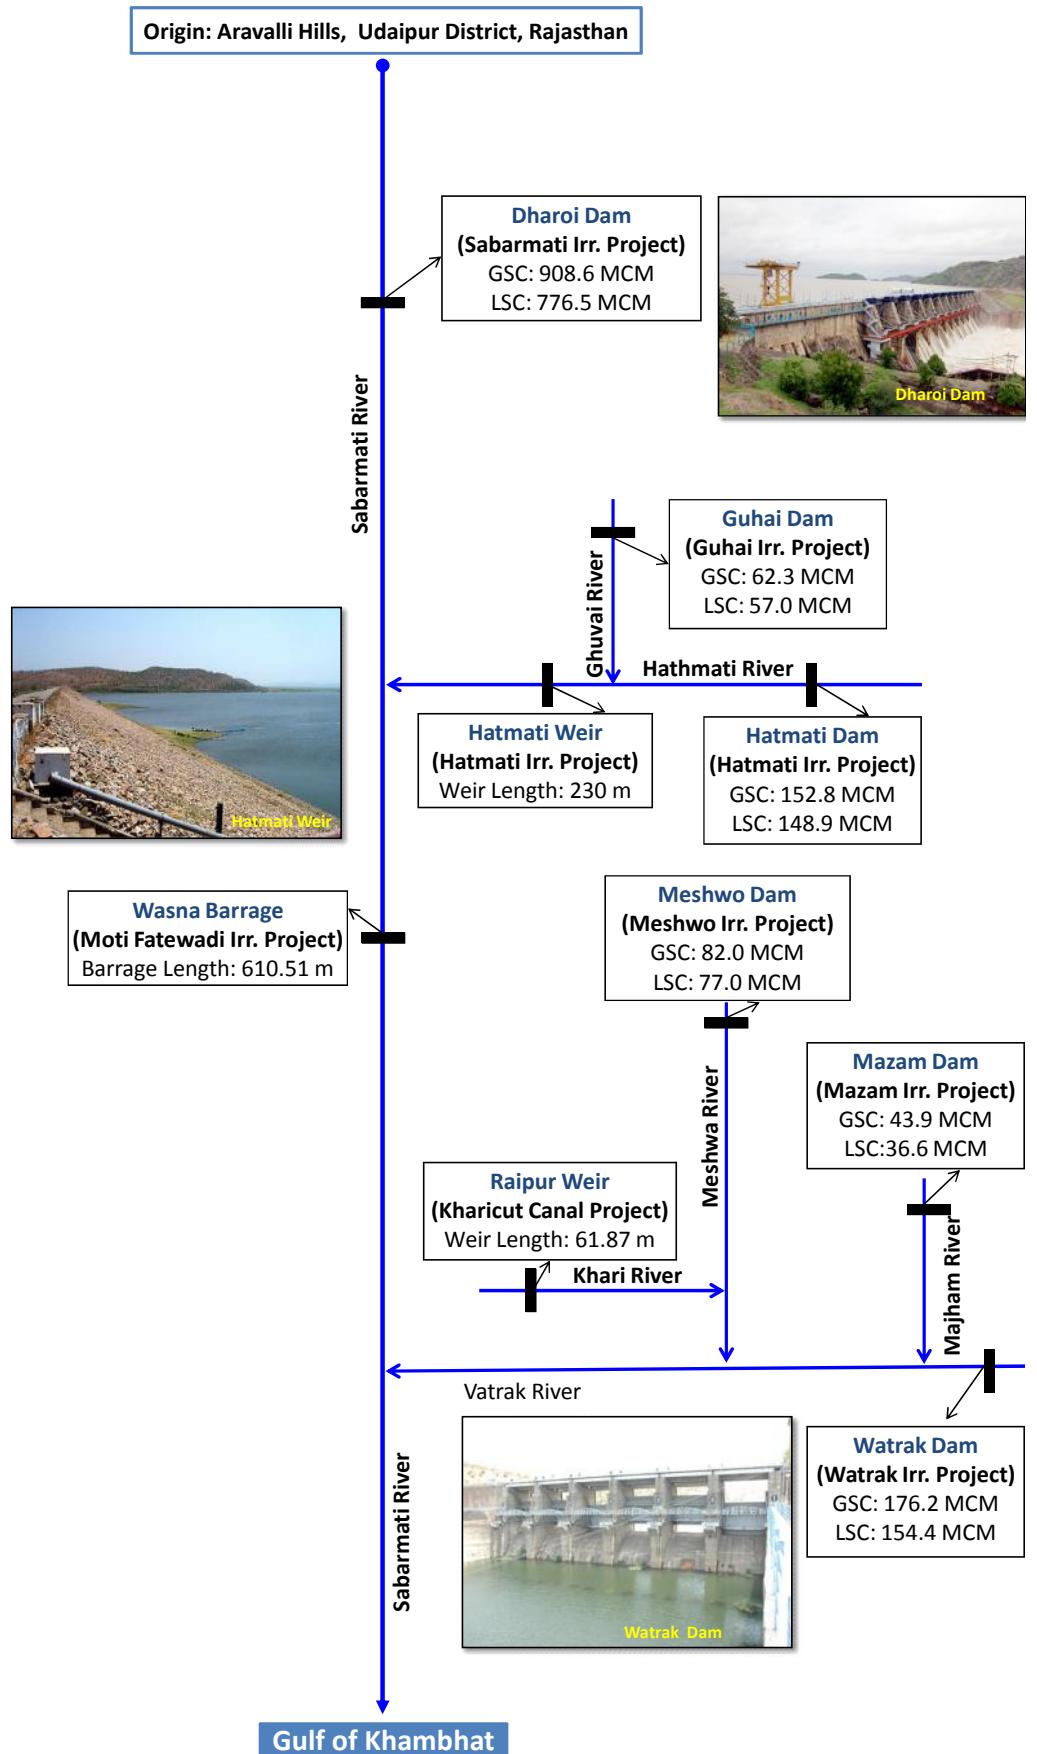

The Sabarmati River, with its origin in Rajasthan, flows generally in south west direction. It enters the Gujarat State and passes through the plains and continues to flow in the same direction and joins the Gulf of Khambat in the Arabian Sea. The Dharoi Dam, Watrak, Meshwo, Moti fatewati and Hathmati are the major projects in the catchment areas of Sabarmati sub-basin. The basin contains two climatic regions, the northern part of the basin comprises sub tropical wet climate (generally basin area occupied by Gujarat). The major part of the basin comprises tropical wet climate, caused mainly due to existence of Aravalli and the Western Ghats. The temperature of the basin varies from 0° to 42°C . The average rainfall in the Sabarmati basin is about 787.5 mm.

2.15.1 Irrigation Projects: Sabarmati irrigation project (Dharoi Dam), Watrak irrigation project, Moti Fatewadi are major projects in the basin.

2.15.2 Hydrological Observation (H.O.) Sites: There are 13 sites in total in the basin, out of which 7 sites for Gauge(G), 4 for Gauge & Discharge(GD), 1 for Gauge, Discharge, Water Quality (GDQ) and 2 for Gauge, Discharge, Sedimentation and Water Quality(GDSQ).

Sabarmati River Flow Line Diagram

2.15.3 Land Use Statistics: Table 2.15.1 to Table 2.15.3 present below the land use pattern, gross irrigated area and net irrigated area for Sabarmati basin as compared to all basins (Region-III).

2.16 WEST FLOWING RIVERS OF KUTCH AND SAURASHTRA INCLUDING LUNI

Location: The basin extends over large areas in Rajasthan and Gujarat and covers whole of Diu having an area of 321,851 Sq. km with maximum length and width of 865 km and 445 km. It lies between $67^{\circ} 52'$ to $75^{\circ} 19'$ east longitudes and $20^{\circ} 53'$ to $26^{\circ} 57'$ north latitudes. The basin is bounded by Aravalli range and Gujarat plains on the east, by Rajasthan desert on north, and by the Arabian Sea on the south and the west.

Luni is the major river system of the basin. Other independent rivers of the basin are the Shetrungi, the Bhadar, the Machhu, the Rupen, the Saraswati and the Banas.

The major part of the basin is covered with agriculture accounting to 65.06% of the total area and only 5.25% of the basin is covered by water bodies. Brief descriptions of the rivers are given below.

2.16.1 Luni Basin: The Luni is the only significant river basin in Western Rajasthan which forms the bulk of arid zone. Luni originates from Western slopes of the Aravalli ranges at an elevation of 772m above msl near Ajmer flowing in South West direction and traversing a course of 511 km in Rajasthan before it finally flows into the Rann of Kutchh. Its total catchment 32879 sq km area falls in Rajasthan. Luni basin is situated in between $24^{\circ} 11'$ to $26^{\circ} 43'$ North latitude and $70^{\circ} 37'$ to $74^{\circ} 39'$ East longitude approximately. The peculiarity of this river is that it tends to increase its width rather than deepening the bed because the banks are of soils which are easily erodable whereas beds are of sand. The floods develop and disappear so rapidly that they have no time to scour the bed. The Aravalli ranges forms its East boundary whereas main course of river in Barmer district itself forms North boundary and mostly Banas and initial reach of Chambal River form its Southern boundary. Luni receives all the main tributaries on its left bank except one i.e. Jojari (Mithri) on the right bank. Luni receives ten tributaries namely Lolari, Guhiya, Bandi (Hemawas), Sukri (Hemawas), Sukari, Mithri, Jawai, Khari Bandi and Sugi. Hence the drainage on the left bank of Luni is, therefore, more extensive than on Right Bank. The Luni drains an area of 32,879 sq Km in Rajasthan State only. The rainfall in the basin is erratic and its distribution is uneven in the catchment. The temperature of the basin ranges from 5° to 46°C . There are 2 sites for Gauge and Discharge.

2.16.2 Banas Basin: The river Banas originates from Aravalli hills and descends in a South-Western direction through Rajasthan state and travels through Banaskantha and Mehsana district of Gujarat before it drains into little Rann of Kutchh. The Banas basin is the Northern basin and is situated between $23^{\circ} 30'$ & $24^{\circ} 55'$ north latitudes and $71^{\circ} 15'$ to $73^{\circ} 15'$ east longitudes approximately. Saraswati and Luni basins form the Southern and Northern boundaries of this basin. The Aravalli hills form its eastern extremity. The Banas drains an area of 8,674 sq km out of which nearly 37.69% lies in Rajasthan state and remaining 62.31% falls in Gujarat state. The Banas River rises near Pindwara of Sirohi district of Rajasthan at an elevation of 372.51m above msl. Little Rann of Kutchh is the outfall of Banas river. Sipu is the only right bank tributary of Banas River which drains into the main channel. There are 6 tributaries on the left bank of Banas River namely the Batria, the Sukli, the Sewaran, the Suket, the Balaram and the Khari which drain into the main channel. Hence the draining system on the left bank of the Banas River is more extensive as compared to the right bank area. The Sipu and the Khari are the two important right and left bank tributaries which together drain nearly 37% of the total catchment area of Banas. The Sipu Dam, Swarupgunj and Dantiwada Dam are the major projects in the catchment areas of Banas sub-basin. There are 4 sites for

Gauge only(G), 1 site for Gauge & Discharge (GD), 2 sites for Gauge, Discharge & Water Quality(GDQ) and 1 for Gauge, Discharge, Sedimentation & Water Quality(GDSQ).

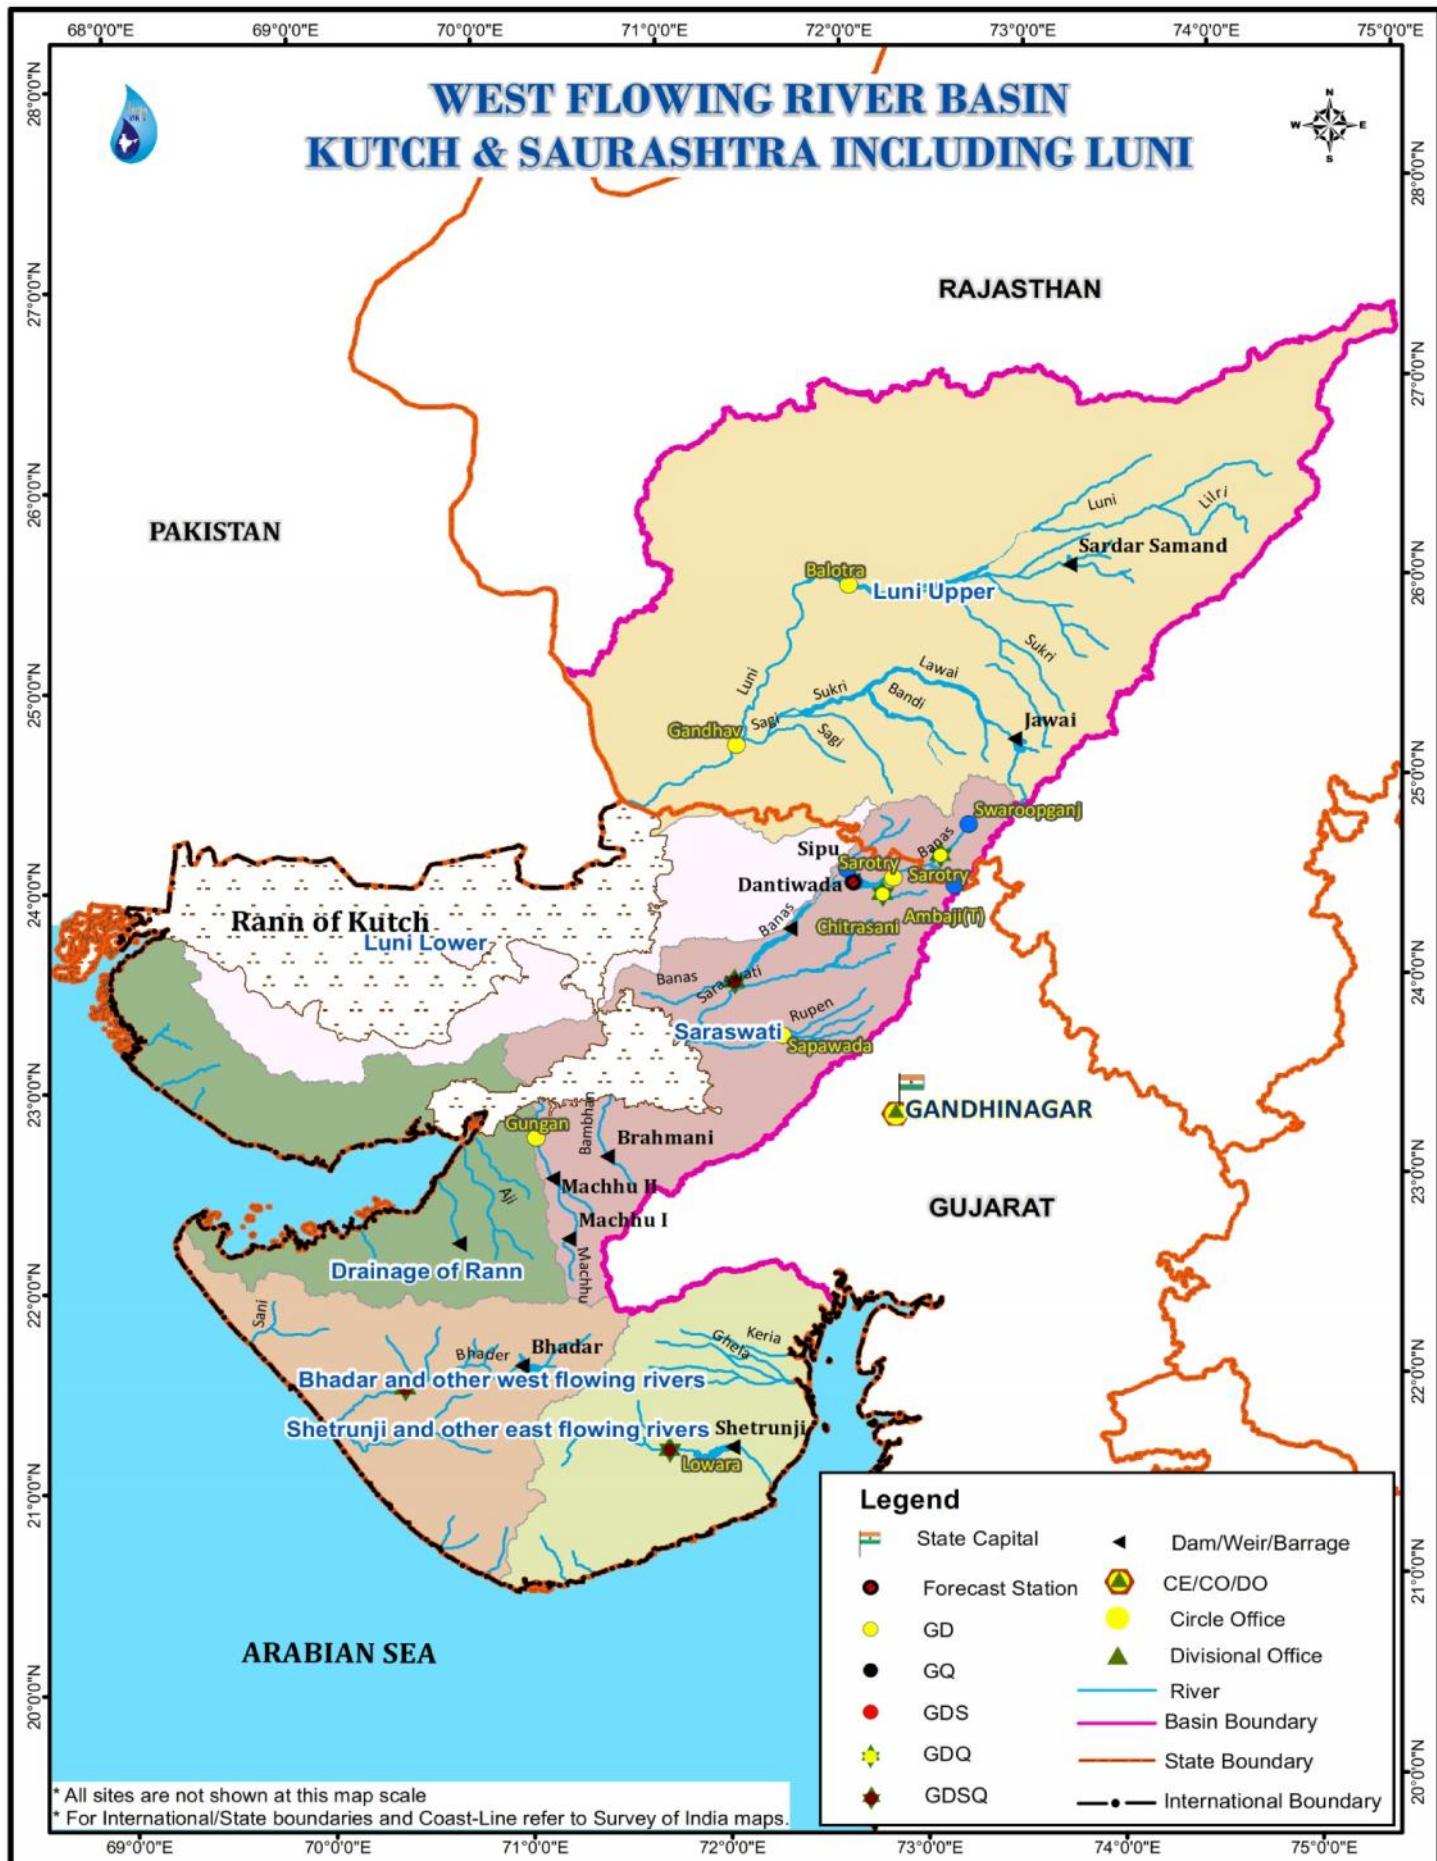

2.16.3 Shetrunji Basin: The Shetrunji is one of the major rivers of Saurashtra. The Shetrunji basin is the Eastern most basin of Saurashtra and is situated in between $21^{\circ} 00'$ to $21^{\circ} 47'$ North latitude and $70^{\circ} 50'$ to $72^{\circ} 10'$ East longitude. The river Shetrunji originates at Chachai hills in Gir forest of Junagarh district at an elevation of 380m above msl and flows towards East direction till its confluence with Gulf of Khambat near Santhrampur port. The river Shetrunji fertile the Amerli and Bhavanagar districts and a small area of Junagarh district of Saurashtra. The Shetrunji drains an area of 5,514 sq km out of which more than 50% is in Amerli district. The total length of the river from its origin to the outfall into the Gulf of Khambat is 182 km. This river receives tidal influence for a length of 5 km from mouth. The Shetrunji receives several tributaries on both banks. There are 9 tributaries having lengths more than 15 km out of which Safara, Shel, Khari and Talaji are the 4 tributaries on the right bank of Shetrunji and the remaining 5 tributaries namely Stali, Gagaria, Rajwal and Kharo are on left bank. The drainage system on left bank of Shetrunji is more extensive as compared to the right bank area. The Stali, Theli and Gagaria are important tributaries feeding from left bank of Shetrunji and drain nearly 34% of total catchment area of river Shetrunji. The *Shetrunji Irrigation Scheme* is the only major project in the catchment areas of the river basin. There is one site for Gauge, Discharge, Sedimentation and Water Quality.

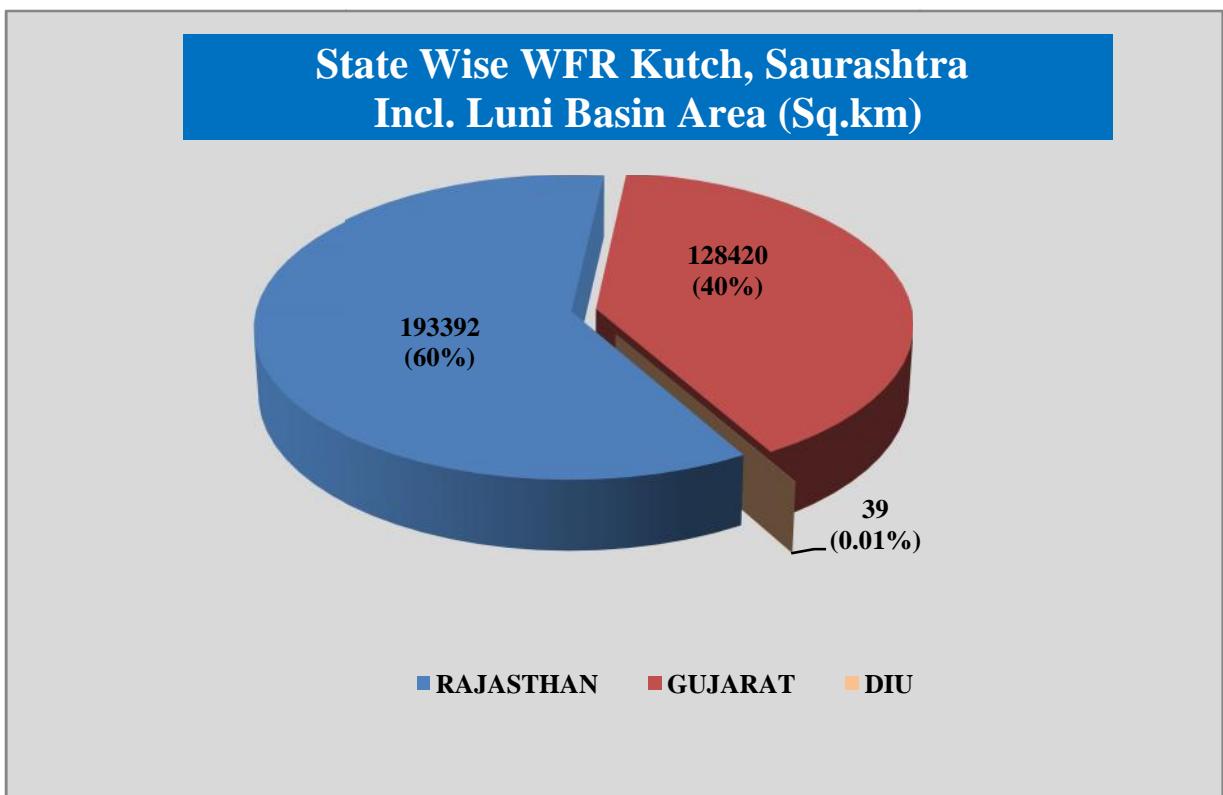

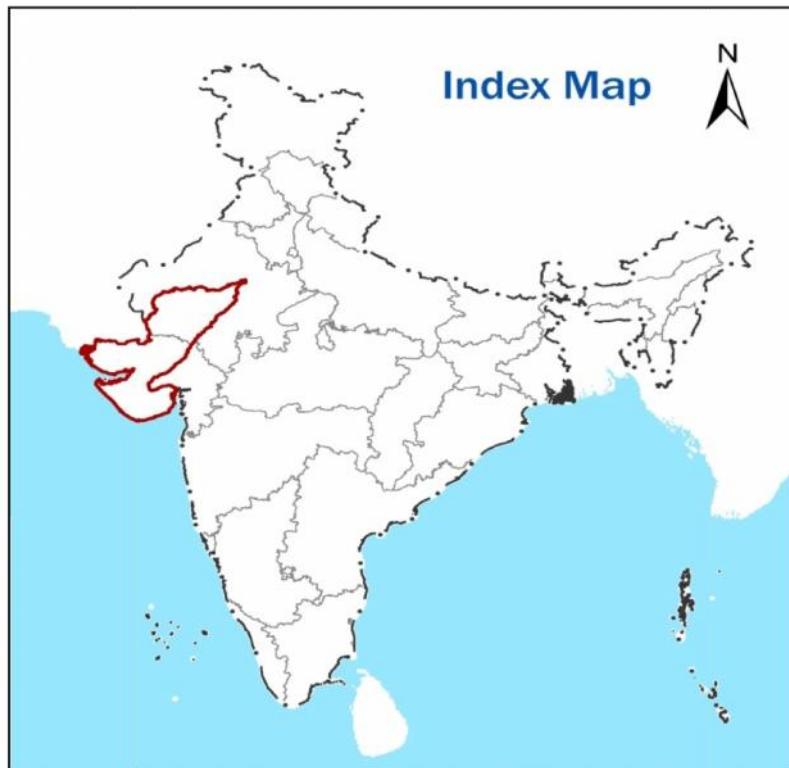

2.16.4 Bhadar Basin: Bhadar is one of the major rivers of Saurashtra and it drains about $1/7^{\text{th}}$ of the area of Saurashtra. The Bhadar basin is the south western basin and situated between $21^{\circ} 25'$ to $22^{\circ} 10'$ north latitude and $69^{\circ} 45'$ to $71^{\circ} 20'$ east longitude. The river Bhadar originates at an elevation of 261m above msl in Vaddi about 26 km north-west of Jasdan in Rajkot district and flows towards south upto Jasdan village and then turns towards south-west upto village Jetpur and finally changes its direction towards west till its confluence with Arabian sea at Navibandar (Porbandar). The Bhadar River, from Jetpur to Porbandar, fertiles Rajkot, Jamnagar, Amreli and Junagadh district of Saurastra. The river drains an area of 7,094 sq km out of which 706 sq km is in hill and the rest in plain regions of Saurashtra. The total length of this South West flowing river from its origin to its outfall into the sea is 198 km. For the first 150 km, the river flows in Rajkot district and the rest of 48 km in Junagarh district. The river receives tidal influence for a length of about 26 km from mouth in Junagadh district. The river Bhadar receives several tributaries on both the banks. There are 9 major tributaries having a length of more than 25 km out of which 6 tributaries namely Gondali, Chapparwadi, Phopal, Utawali, Moj and Venu are feeding from right and the remaining 3 tributaries namely Vasavadi, Surwa and Galolia from left. The drainage system on the right bank of river Bhadar is more extensive as compared to the left bank. The *Bhadar Irrigation Scheme* is the only major project in the catchment areas of the river basin. There is one site for Gauge, Discharge, Sedimentation and Water Quality.

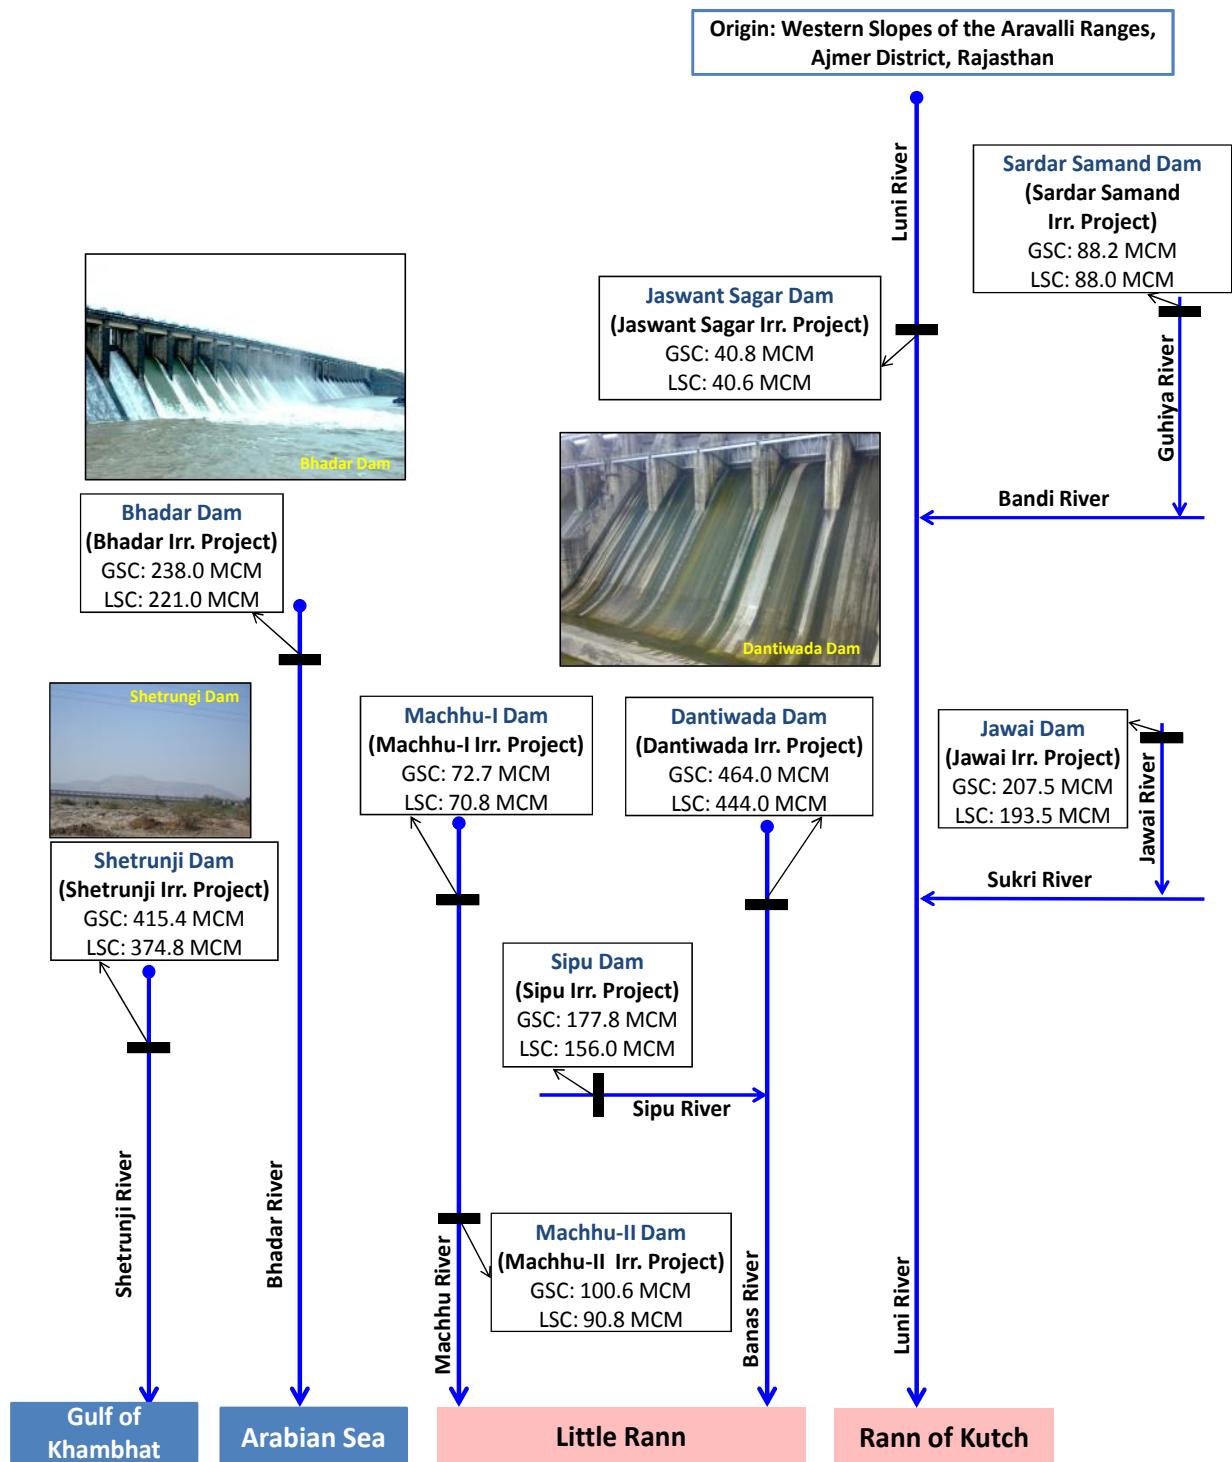

2.16.5 Machhu Basin: The Machhu River originates from hilly ranges of Jasdan Sardar and Mandva in Rajkot district and Chotila in Surendranagar district and flows in north westerly direction along the district boundary of Surendranagar and Rajkot upto village Beti and then flows mostly towards north in Rajkot district and finally disappears near Malia in the little Rann of Kachchh. The Catchment area of the basin is 2515 sq km. The complete catchment area is located between $22^{\circ} 10'$ to $23^{\circ} 10'$ north latitude and $70^{\circ} 40'$ to $71^{\circ} 15'$ east longitude. The main tributaries of this river are Beti, Asoi, Machhori and Maha, together account for nearly 42.52% of the total catchment area of Machhu. *Machhu-I* and *Machhu-II* are medium Irrigation projects in the basin. There is one site for Gauge and Discharge.

2.16.6 Rupen Basin: The Rupen River originates from taranga hill ranges near Kheralu taluka of Mehsana district of Gujarat at an elevation of 180 metre above metre.s.l and decends in south western direction and travels through Mehsana district before it drains into little Rann of Kachchh. The Rupen basin is a northern basin of Gujarat and is situated between $23^{\circ} 25'$ to $24^{\circ} 00'$ north latitude and $71^{\circ} 30'$ to $72^{\circ} 46'$ east longitude approx. The total drainage area of Rupen River is 2,500 sq km. The important tributaries of Rupen are Pushpavati and Khari. Owing to topographical characteristics the climate is variable in the basin. There is one site for Gauge and Discharge.

2.16.7 Hydrological Observation Sites: There are in total 15 H.O. sites in the basin, out of which 4 sites are for Gauge observations only (G), 5 sites for Gauge & Discharge (GD), 2 sites for Gauge, Discharge & Water Quality (GDQ) and 3 sites for Gauge, Discharge, Sedimentation & Water Quality (GDSQ) and one site for Rainfall measurement (as per 2014-15 data).

2.16.8 Urban Centre: Ahmedabad & Vadodara are two important cities on west flowing rivers basin.

2.16.9 Industries: There are important industries of Engg Handicraft, Stonework, cement, chemical, Liquor, Sugar, Tex and wools etc.

2.16.10 Minerals: Important minerals found in the basin are Phyllites, gneisses, Quartzite and Granite.

Tolerance and Classification

As per IS: 2296-1992, the tolerance limits of parameters are specified as per classified use of water depending on various uses of water. The following classifications have been adopted in India.

Designated Best Uses of Water

Designated Best Use	Class	Criteria
Drinking Water Source without conventional treatment but after disinfection	A	<ol style="list-style-type: none">1. Total Coliforms Organism MPN/100ml shall be 50 or less2. pH between 6.5 and 8.53. Dissolved Oxygen 6mg/l or more4. Biochemical Oxygen Demand 5 days 20 °C, 2mg/l or less
Outdoor bathing (Organised)	B	<ol style="list-style-type: none">1. Total Coliforms Organism MPN/100ml shall be 500 or less2. pH between 6.5 and 8.53. Dissolved Oxygen 5mg/l or more4. Biochemical Oxygen Demand 5 days 20 °C, 3mg/l or less
Drinking water source after conventional treatment and disinfection	C	<ol style="list-style-type: none">1. Total Coliforms Organism MPN/100ml shall be 5000 or less2. pH between 6 and 93. Dissolved Oxygen 4mg/l or more4. Biochemical Oxygen Demand 5 days 20 °C, 3mg/l or less
Propagation of Wild life and Fisheries	D	<ol style="list-style-type: none">1. pH between 6.5 and 8.52. Dissolved Oxygen 4mg/l or more3. Free Ammonia (as N)4. Biochemical Oxygen Demand 5 days 20 °C, 2mg/l or less
Irrigation, Industrial Cooling, Controlled Waste disposal	E	<ol style="list-style-type: none">1. pH between 6.0 and 8.52. Electrical Conductivity at 25 °C micro mhos/cm, maximum 22503. Sodium absorption Ratio Max. 264. Boron Max. 2mg/l
	Below - E	Not meeting any of the A, B, C,D & E criteria

Glossary of Terms

Glossary of Terms

Active (usable) storage capacity	The total amount of reservoir capacity normally available for release from a reservoir below the maximum storage level. It is total or reservoir capacity minus inactive storage capacity. More specifically, it is the volume of water between the outlet works and the spillway crest.
Alluvium	Sediments deposited by erosion processes, usually by streams.
Area Sown more than once	This represents the areas on which crops are cultivated more than once during the agricultural year. This is obtained by deducting 'Net Area Sown' from 'Total Cropped Area'.
Area under Non-agricultural Uses	This includes all lands occupied by buildings, roads and railways or under water, e.g. rivers and canals and other lands put to uses for other than agricultural purposes.
Barren and Unculturable Land:	This includes all barren and unculturable land like mountains, deserts, etc. land whether such land is in isolated blocks or within cultivated holdings which cannot be brought under cultivation, except at an exorbitant cost, is classified as unculturable land
Basin boundary	The topographic dividing line around the perimeter of a basin, beyond which overland flow (i.e., runoff) drains away into another basin.
Bed load	Sand, silt, gravel, or soil and rock detritus carried by a stream on or immediately above its bed. The particles of this material have a density or grain size such as to preclude movement far above or for a long distance out of contact with the stream bed under natural conditions of flow.
Bed material	The sediment mixture of which a streambed, lake, pond, reservoir, or estuary bottom is composed.
Biochemical Oxygen Demand (B.O.D.)	The measure of oxygen required for natural oxidation of organic matter with the aid of bacteria. The test is made by taking duplicate samples of water in two completely filled bottles, one of which is sealed and kept stored for 5 days. The dissolved oxygen content of the first sample gives the biochemical oxygen demand, or shortly B.O.D. value. The B.O.D. value of surface waters may be 1 to 10 p.p.m., and for deep well water it would be much less.

Coliform Group	All waters contain bacteria, vast majority of which are perfectly harmless. One organism, bacillus Coli, found in the intestines of men and warm-blooded animals, which in itself is usually quite and may therefore be regarded as danger signal. The group of bacteria of intestinal origin is known as coliform group. The bacilli of this group ferment lactose with gas formation. Since organisms of the coliform group normally live longer in water than other bacteria, absence of such organisms indicates that the water is safe. Also this group is more resistant to treatment than pathogens, their existence or otherwise gives a useful indication of the efficiency of water treatment methods.
Coliform Index	The probable number of coliform organisms present in 100 ml. is known as coliform index. If out of 5 portions be isolated from one sample only, the number of coliforms would be considered to be 1 in 50 ml. or 2 in 100 ml., which would be the coliform index, assuming that the gas formation was due to one coliform only.
Culturable Waste Land	This includes land available for cultivation, whether not taken up for cultivation or taken up for cultivation once but not cultivated during the last five years or more in succession including the current year for one reason or the other. Such lands may be either fallow or covered with shrubs and jungles which are not put to any use. They may be assessed or unassessed and may lie in isolated blocks or within cultivated holdings.
Current Fallows	This represents cropped area, which are kept fallow during the current year. For example, if any seeding area is not cropped against the same year it may be treated as current fallow.
dam	Any artificial barrier which impounds or diverts water. A dam is generally considered hydrologically significant if it is (i) One and one quarter feet (0.4 meters) or more in height from the natural bed of the stream and has a storage of at least 15 acre-feet, or (ii) has an impounding capacity of 50 acre-feet or more and is at least six feet (2 meters) above the natural bed of the stream.
Discharge	The quantity of water flowing across a section of a channel in a unit time is called the discharge. It is measured in cubic feet or meters per second, briefly called cusecs and cumecs respectively and is equal to the area of section X average velocity. Common units are cubic feet per second (cfs), second-day feet (sdf), and cubic meter per second (cumecs). Two types of discharges are often measured and recorded: (i) instantaneous discharge: the discharge at a particular instant of time. (ii) mean discharge: the arithmetic mean of individual discharges during a period of time. Discharges given are daily observed discharges commencing at 08.00 hrs.
Drainage area	An area around a river and rainfall of which flows into the river. Also known as watershed, catchment area and drainage basin.

Drainage basin	A part of the earth's surface which is occupied by a drainage system which consists of a surface stream with all its tributaries and impounded bodies of water. Also known as watershed, catchment area, and drainage area.
Fallow Land	This includes fallow land other than current fallows and current fallow land of land use classification which are explained below.
Fallow Lands other than Current Fallows	This includes all lands, which were taken up for cultivation but are temporarily out of cultivation for a period of not less than one year and not more than five years.
Forest	This includes all lands classified as forest under any legal enactment dealing with forests or administered as forests, whether state-owned or private, and whether wooded or maintained as potential forest land. The area of crops rose in the forest and grazing lands or areas open for grazing within the forests remains included under the forest area.
Gross capacity	The maximum volume of water that can be stored in a reservoir.
Gross reservoir capacity	The total amount of storage capacity available in a reservoir for all purposes from the streambed to the normal water or normal water or normal pool surface level. It does not include surcharge, but does include dead storage.
Ground water	Water within the earth that supplies wells and springs; water in the zone of saturation where all openings in rocks and soil are filled, the upper surface of which forms the water table. Also termed Phreatic water.
Ground water runoff	That part of the runoff which has passed into the ground, has become ground water, and has been discharged into a stream channel as spring, or seepage water.
Hardness	Hardness of water is generally caused by the presence of salts of calcium and magnesium. Hardness due to the presence of bicarbonates of calcium and magnesium is called temporary hardness. Permanent hardness is caused by the presence of sulphates and chlorides of these metals, and is not removable by boiling. The sum of these two hardness is called total hardness. It is expressed in terms of calcium carbonate. Since one gallon of water weighs 70,000 grains, degrees of hardness can be converted in p.p.m. by multiplying by 14.3. A water having 50 to 100 p.p.m. hardness is called soft water, one with 100 to 200 p.p.m. Moderately hard, and that with 200 to 300 p.p.m. hard. Hardness of 80 to 90 p.p.m. is considered to be the best.
Headwater basin	A basin at the headwaters of a river. All discharge of the river at this point is developed within the basin.

Hydrogen-ion Concentration (pH)	<p>Acidity and Alkalinity determinations is the measures of acid and alkali present, while the H-ion concentration determines the strength of the acid and alkali in water. An ion is an atom or a group of atoms that carries an electric charge.</p> <p>The H-ion concentration is expressed in terms of logarithm of the reciprocal of the H-ion concentration. This term is called the pH value (potential of Hydrogen). Log 1/10⁻⁷ = 7, so that pH value 7 denotes neutrality while values above 7, signify alkalinity and those below 7, acidity. The determination of pH value provides information concerning the corrosive character of water. Waters with pH between 7.4 and 8.4 are practically inactive.</p> <p>Waters with pH above 8.6 or 8.8 are likely to cause precipitation of calcium carbonate in the distribution system, while waters over-carbonate with CO₂ may dissolve the slight carbonate film on the inside of mains and start active corrosion, depending upon the pH value. When the pH of natural waters is below 7 it may be found necessary to add a small amount of soda ash or lime to the water before admittance to the mains, as otherwise corrosion may be caused.</p>
Hydrologic Cycle	Water is lost to the atmosphere as vapour from the earth, which is then precipitated back in the form of rain, snow, hail, dew, frost, etc. The process of evaporation and precipitation which combines forever and thereby maintaining a balance between the two is called Hydrologic Cycle.
Hydrologic unit	A geographical area representing part or all of a surface drainage basin or distinct hydrologic feature such as a reservoir, lake, etc.
Inactive storage Capacity	The portion of capacity below which the reservoir is not normally drawn, and which is provided for sedimentation, recreation, fish and wildlife, aesthetic reasons, or for the creation of a minimum controlled operational or power head in compliance with operating agreements or restrictions.
Inches of runoff	the volume of water from runoff of a given depth over the entire drainage.
Irrigated area	The gross farm area upon which water is artificially applied for the production of crops, with no reduction for access roads, canals, or farm buildings.
Irrigation efficiency	The percentage of water applied that can be accounted for in soil moisture increase for conjunctive use.
Irrigation requirement	The quantity of water, exclusive of precipitation, that is required for crop production. It includes surface evaporation and other economically unavoidable wastes.

Land under Miscellaneous Tree Crops, etc	This includes all cultivable land which is not included in 'Net area sown' but is put to some agricultural use. Lands under Casuarinas trees, thatching grasses, bamboo bushes and other groves for fuel, etc. which are not included under 'Orchards' are classified under this category.
Live capacity	The minimum volume of water required for maintaining flow of water from the Reservoir. It is the total amount of storage capacity available in a reservoir for all purposes, from the dead storage level to the normal water or normal pool level surface level. Does not include surcharge, or dead storage, but does include inactive storage, active conservation storage and exclusive flood control storage.
Long term storage dams	Reservoirs used for recreational use or storage of irrigation, municipal or industrial water. Because water is impounded on a "permanent" basis, the design of these dams is more complex than for tailings or flood control detention dams. A long term storage dam may include an impermeable core surrounded by shell material; have many types of drains and filters, outlet works, with gates and valves, seepage collection boxes, and possibly several spillways. The capacity of the spillway is dependent upon the downstream hazard potential.
Mean annual rainfall	Mean annual rainfall is usually worked out as a simple average of the total rainfall of various years.
Mean depth	The average depth of water in a stream channel or conduit. It is equal to the cross-sectional area divided by the surface width.
Moisture equivalent	The ratio of (1) the weight of water which the soil, after saturation, will retain against a centrifugal force 1,000 times the force of gravity, to (2) the weight of the soil when dry. The ratio is stated as a percentage.
Net Area Sown	This represents the total area sown with crops and orchards but area sown more than once in the same year is counted only once.
Net rainfall	The portion of rainfall which reaches a stream channel or the concentration point as direct surface flow.
Normal year	The year during which the precipitation or stream flow approximates the average for a long period of record.
Not available for cultivation	This includes area under non-agricultural uses and barren & unculturable land which are briefly described below.
Other Cultivated land excluding fellow land	This includes (i) permanent pastures and other grazing land (ii) land under miscellaneous trees, crops and groves not included in net area and (iii) culturable waste land which are briefly described below.
Peak discharge	Rate of discharge of a volume of water passing a given location. (Usually in cubic feet per second.)

Permanent Pastures and other Grazing Lands	This includes all grazing lands whether they are permanent pastures and meadows or not. Village common grazing land is included under this head.
Point discharge	Instantaneous rate of discharge, in contrast to the mean rate for an interval of time.
Point precipitation	Precipitation at a particular site, in contrast to the mean precipitation over an area.
Reporting Area for Land Utilisation Statistics	The Reporting area stands for the area for which data on land use classification of area are available. In areas where land utilization figures are based on land records, reporting area is the area according to village papers, i.e. the papers prepared by the village accountants. In some cases, the village papers may not be maintained in respect of the entire area of the State. For example, village papers are not prepared for forest areas for which no village paper exists for which ad-hoc estimates of classification of area etc. framed to complete the coverage.
River Basin	Drainage area of a river and its tributaries.
River gauge datum	The arbitrary zero datum elevation which all stage measurements are made from.
Runoff	Water which is not absorbed by the soil and flows to lower ground, eventually draining into a stream, river, or other body of water. It is that part of precipitation that flows toward the streams on the surface of the ground or within the ground. Runoff is composed of base flow and surface runoff.
Runoff/ potential	Runoff/ potential of a river for a specified period at a site is the total volume of water flow/passed from/through the site during the specified period. It is the notional depth of water in mm over the catchment, equivalent to annual runoff (in M.Cum.)/Catchment Area (km ²)* 1000 and calculated at the discharge measurement station.
Second-day feet	The volume of water represented by a flow of one cubic foot per second for 24 hours; equal to 84,000 cubic feet. This is used extensively as a unit of runoff volume. Often abbreviated as SDF.
Sediment storage capacity	The volume of a reservoir planned for the deposition of sediment.
Soil moisture	Water contained in the upper regions near the earth's surface.
Stage	The level of the water surface above an established "zero" plane or datum at a given location.
Surface runoff	The runoff that travels overland to the stream channel. Rain that falls on the stream channel is often lumped with this quantity.

Surface water	Water that flows in streams and rivers and in natural lakes, in wetlands, and in reservoirs constructed by humans.
Temperature	The in-situ temperature in degree centigrade by thermometer is recorded in terms of water intended use, the treatment to remove impurities and its transport.
Total Cropped Area	This represents the total area covered with crops, i.e. the sum total of areas covered by all the individual crops; areas sown with crops more than once during the year being counted as separate areas for each crop. It is also known as Gross Cropped Area.
Tributary	A stream or river whose water flows into a larger stream or river.
Watershed	The sum total of all the land and smaller bodies of water which drains into a particular stream or river.
Zero R.L. of gauge	The Zero R.L. of a gauge is the datum level fixed for a given site, which is kept 1 or 2 m lower than the lowest water level recorded in a perennial stream. In a no perennial stream, it is kept 1 or 2 m lower than the lowest bed level of the stream.

ABBREVIATIONS AND SYMBOLS

-	:	Anion
+	:	Cation
$^{\circ}\text{C}$:	Degree Centigrade
BCM	:	Billion Cubic Meter
BOD	:	Bio-Chemical Oxygen Demand
cumec	:	Cubic Meter per Second
