## FOREWORD

Water is the most essential element for life existence on earth. However, the quality of the world's water has been deteriorating with exponential growth in human population and its needs for industrial and agricultural activities. Central Water Commission (CWC) has been playing a vital role in water quality monitoring of river water over the past years and at present, is observing water quality at 764 key locations covering all major river basins of India.

Metal contamination in river water is increasingly becoming common in India. Presence of metals in river water in excesses may cause a significant threat to human health and ecological systems. The present report attempts to provide the water quality scenario of Indian rivers in respect of trace & toxic metals. Based on the analysis results of various metal elements, first, second and third edition of the Status of Trace and Toxic Metals in Indian Rivers was published by River Data Directorate, CWC, in May, 2014, April, 2018, and August, 2019 respectively. The revised and comprehensive edition of this report comprising the data of eight elements viz; Arsenic, Cadmium, Chromium, Copper, Iron, Lead, Nickel and Zinc for the period from Aug, 2018 to Dec, 2020. The report brings out the identified locations having these metal concentrations beyond the exceeding limits according to the BIS 10500:2012.

I appreciate the hard work done and efforts put in by Shri Reading Shimray, Chief Engineer (P&DO), CWC; Shri Pankaj Kumar Sharma, Director, RDC-II, CWC, Shri Rakesh Kumar Gupta, Dy. Director, RDC-II, CWC, Shri Devendra Kumar Patel, Assistant Director and Dr. Sakshi Sharma, SRA, RDC-II, CWC in bringing out fourth edition of this publication. I also express sincere thanks to all field Chief Engineers of CWC for making arrangements for collection, transportation and analysis of river water samples even during the nationwide lockdown. Efforts put in by Scientific officials of NRWQL, YBO, CWC for analysing river water samples are also appreciated.

I hope this publication will be useful for all stake holders and agencies for taking remedial measures for conservation of river water quality, protection, management, planning and policy making. It will also be useful for climate change & water security assessment and academic & scientific research purpose.

## EXECUTIVE SUMMARY

Central Water Commission (CWC) is monitoring river water quality at its 652 key hydrological observation stations covering all the important river basins of India. Also, water quality samples are being collected from 112 water quality sampling stations. Heavy metals are one of the most widespread causes of pollution in water. Further, increasing levels of these metals concentration in the environment is causing serious concern in public opinion owing to their toxicity. To observe the current status of toxic metal content of Indian Rivers, 3113 no. of river water samples from 688 water quality monitoring stations spread over major river basins in India were collected during Aug, 2018 to Dec, 2020. These samples were analyzed for **Arsenic, Cadmium, Chromium, Copper, Nickel, Lead, Iron and Zinc** at National River Water Quality Laboratory, Central Water Commission, New Delhi. Toxic metal wise summary of the results is as under:

**Arsenic (As)** BIS (Bureau of Indian Standard) 10500:2012) has recommended an acceptable limit of 10 µg/L of arsenic in drinking water. Total 2834 numbers of water samples from 688 water quality monitoring stations were collected and analyzed for arsenic content in Indian Rivers in the period Aug, 2018 to Dec, 2020. Out of 2834 water samples, 8 no. of samples of 8 water quality stations found arsenic concentrations beyond the acceptable limit. The arsenic concentration varies from 0.00 to 13.33 µg/L. Maximum arsenic concentration (13.33 µg/L) was observed at Porakudi water quality monitoring station on Arasalar River (a tributary of Cauvery River) during Dec, 2019.

As Permissible Limit as BIS 10500: 2012	10 µg/L
No of Samples Tested	2834
No. of Samples Exceed the Limit	8
No. of Stations	8

**Cadmium (Cd)** BIS (Bureau of Indian Standard) 10500:2012) has recommended an acceptable limit of 3 µg/L of cadmium in drinking water. Total 3113 numbers of water samples were analysed and collected from 688 water quality monitoring stations for cadmium content in Indian Rivers during the period Aug, 2018 to Dec, 2020. Out of 3113 water samples, 11 no. of samples of 11 water quality stations found cadmium concentrations beyond the acceptable limit. The cadmium concentration varies from 0.00 to 12.57 µg/L. Maximum cadmium concentration (12.57 µg/L) was observed at Todarpur water quality monitoring station on Sukheta River during Dec, 2020.

Cd Permissible Limit as BIS 10500: 2012	3 µg/L
No of Samples Tested	3113
No. of Samples Exceed the Limit	11
No. of Stations	11

**Chromium (Cr)** BIS (Bureau of Indian Standard) 10500:2012) has recommended an acceptable limit of 50 µg/L of chromium in drinking water. Total 3106 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Chromium content in Indian Rivers during the period Aug, 2018 to Dec, 2020. Out of 3106 water samples, 50 no. of samples of 46 water quality stations found Chromium concentrations beyond the acceptable limit. The Chromium concentration varies from 0.00 to 180.47 µg/L. Maximum Chromium concentration (180.47 µg/L) was observed at M.B.P.L. water quality monitoring station on Hasdeo River during Dec, 2019.

**Copper (Cu)** BIS (Bureau of Indian Standard) 10500:2012) has recommended an acceptable limit of 50 µg/L of copper in drinking water. 3107 water samples from 688 water quality stations were collected

and analyzed for copper content from Aug, 2018 to Dec, 2020. Out of 3107 water samples, 17 samples of 17 water quality stations were found to contain copper concentrations above the acceptable limits. The Copper concentration varies from 0.00 to 132.64 µg/L. Maximum Copper concentration (132.64 µg/L) was observed at Badlapur water quality monitoring station on Ulhas River during Dec, 2019.

Cu Permissible Limit as BIS 10500: 2012	50 µg/L
No of Samples Tested	3107
No. of Samples Exceed the Limit	17
No. of Stations	17

**Iron (Fe)** BIS has recommended the acceptable limit of 0.3 mg/L (300 µg/L) for Iron. 3113 water samples from 688 water quality stations were collected and analyzed for Iron content from Aug, 2018

to Dec, 2020. Out of 3113 water samples, 756 samples of 414 water quality stations were found to contain Iron concentrations above the acceptable limits. The Iron concentration varies from 0.00 to 11.24 mg/L.

Fe Permissible Limit as BIS 10500: 2012	300 µg/L
No of Samples Tested	3113
No. of Samples Exceed the Limit	756
No. of Stations	414

**Lead (Pb)** Bureau of Indian Standard (10500:2012) has recommended that the acceptable limit for lead is 0.01 mg/L or 10 µg/L in drinking water. 3111 water samples

from 688 water quality stations were collected and analyzed for Lead content from Aug, 2018 to Dec, 2020. Out of 3111 water samples, 36 samples of 34 water quality stations were found to contain Lead concentrations above the acceptable limits. The Lead concentration varies from 0.00 to 67.55 µg/L. Maximum Lead concentration (67.55 µg/L) was observed at Chopan water quality monitoring station on Sone River during May, 2020

Pb Permissible Limit as BIS 10500: 2012	10 µg/L
No of Samples Tested	3111
No. of Samples Exceed the Limit	36
No. of Stations	34

**Nickel (Ni)** BIS (Bureau of Indian Standard) 10500:2012) has recommended an acceptable limit of 20 µg/L of nickel in drinking water. 3111 water samples from 688 water quality

stations were collected and analyzed for Nickel content from Aug, 2018 to Dec, 2020. Out of 3111 water samples, 265 samples of 199 water quality stations were found to contain Nickel concentrations above the acceptable limits. The Nickel concentration varies from 0.00 to 242.90 µg/L. Maximum Nickel concentration (242.90 µg/L) was observed at Elunuthimangalam water quality monitoring station on Noyyal River during Dec, 2020.

Ni Permissible Limit as BIS 10500: 2012	20 µg/L
No of Samples Tested	3099
No. of Samples Exceed the Limit	265
No. of Stations	199

**Zinc (Zn)** BIS (Bureau of Indian Standard) 10500:2012) has recommended acceptable limit of 5 mg/L (5000 µg/L) of Zinc in drinking water.

Total 3113 water samples from the 688 water quality monitoring stations were analyzed during the reporting period. Maximum Zinc concentration (1.70 mg/L) was observed at Belkheri water quality monitoring station on Sher River (Tributary of Narmada River) during May, 2020. In the study area, all the river water quality stations are reported to have zinc concentration well within the acceptable and permissible limits of Bureau of Indian Standards (BIS) and no toxicity of Zinc in the River waters is observed.

Zn Permissible Limit as BIS 10500: 2012	5000 µg/L
No of Samples Tested	3113
No. of Samples Exceed the Limit	0
No. of Stations	0

In conclusion, out of 688 River water quality stations monitored, water samples collected at 180 water quality stations are found within the permissible limit for all purposes. While 187 stations were obtained beyond the permissible limit due to presence of two or more toxic metals (As/Cd/Cr/Cu/Pb/Ni/Fe).

## **1. INTRODUCTION**

The environmental pollution is caused by a variety of pollutants in water, air and soil. One of the major concerned pollutants of living environment is “Heavy Metals” (metal and metalloid element having density from 3.5 to 7 g/cm<sup>3</sup>). Nowadays, the word ‘heavy metal’ has been used to describe metallic chemical elements and metalloids which are toxic to the environment and humans. Some metalloids and also lighter metals such as selenium, arsenic and aluminium are toxic. They have been termed heavy metals while some heavy metals are typically not toxic such as the element gold.

Beryllium (Be), aluminium (Al), chromium (Cr), manganese (Mn), iron (Fe), cobalt (Co), nickel (Ni), copper (Cu), zinc (Zn), arsenic (As), selenium (Se), molybdenum (Mo), silver (Ag), cadmium (Cd), tin (Sn), antimony (Sb), barium (Ba), mercury (Hg), thallium (Tl) and lead (Pb) are the common toxic ‘heavy metals’ which are of public health concerns as per World Health Organization (WHO).

Over the last few decades, the concentration of these heavy metals in river water and sediments has increased rapidly which may eventually affect the grains and vegetables grown with contaminated soil and water. This may pose a serious threat to humans and the environment because of heavy metal’s toxicity, non-biodegradability and bioaccumulation.

### **Sources of Metal Pollution**

These heavy metals are found naturally on the Earth's crust since the Earth's formation. Natural causes can increase heavy metal pollution such as volcanic activity, metal corrosion, metal evaporation from soil and water and sediment re-suspension, soil erosion, geological weathering. Due to the astounding increase of the use of heavy metals, it has resulted in an imminent surge of metallic substances in both the terrestrial environment and the aquatic environment. Heavy metal pollution has emerged due to anthropogenic activity such as mining the metal, smelting, foundries, and other industries that are metal-based, heavy metals used in pesticides in the agricultural field, leaching of metals from different sources such as landfills, waste dumps, excretion, livestock and chicken manure, runoffs, automobiles and roadworks.

Toxicity of heavy metals depends on a lot of factors such as which metal is present, the nature of the metal, the biological role of the metal, the organism exposed and the period of the organism's life when it is exposed. If one organism is affected, this will affect all the food chain. Since humans are usually the last of the food chain, this will affect us more as we would have accumulated more heavy metal as the concentration increases along the food chain. Both industrial and domestic wastes usually are expelled into the sewage system. Heavy metals are found in high concentrations in raw sewage, and these are not degraded in the sewage treatment. They are removed either in the final effluent or else in the sludge produced. The properties and contaminants of the sewage that enters the water depend on the treatment of the sewage. Several controls have been set up due to the problems caused by sewage elimination into the rivers and seas without being treated. Stringent regulations and better technology need to be placed, to decrease the amounts of pollutants that are thrown in the waters.

## **Metal Pollution from Mining and Processing Ores**

Digging a mine, removing ore from it, and extraction and processing of the minerals sometimes cause environmental damage. For example, mining operations can destroy habitat, farmland, and homes; produce soil erosion; and pollute waterways via toxic drainage. Emission of toxic materials from smelters such as arsenic (As), selenium (Se), lead (Pb), cadmium (Cd), and sulfur oxides, among others — causes serious air pollution. Surface mining produces about eight times as much waste as underground mining, but deep mining can produce even worse problems, such as earthquakes. When underground mines cave in, not only do they kill miners but they also cause subsidence of the surface, forming holes into which roads and houses may collapse. As near-surface minerals are depleted, miners have to dig deeper to find the mineral. A study by the National Academy of Science predicted that copper (Cu) mining operations in the year 2000 would produce three times as much waste per ton of copper output compared to the same activities in 1978.

Exposure of pyrite (FeS) and other sulfide minerals to atmospheric oxygen and moisture results in oxidation of this mineral and the formation of acid-mine drainage water. The release of acid-mine drainage from active and abandoned mines, particularly coal mines, has been widely associated with serious water quality problems. It dissolves toxic elements from tailings and soils and carries them into waterways and even groundwater. Water quality problems involve relatively high levels of metals such as iron (Fe), manganese (Mn), zinc (Zn), copper (Cu), nickel (Ni) and cobalt (Co).

Ore processing, smelting, and refining operations can cause deposition of large quantities of trace metals such as lead (Pb), zinc (Zn), copper (Cu), arsenic (As) and silver (Ag), into drainage basins or direct discharge into aquatic environments.

## **Metal Pollution from Domestic Wastewater Effluents**

Domestic wastewater effluents contain large amounts of trace metals from metabolic waste products, corrosion of water pipes - copper (Cu), lead (Pb), zinc (Zn), and cadmium (Cd), and household products, such as detergents - iron (Fe), manganese (Mn), chromium (Cr), nickel (Ni), cobalt (Co), zinc (Zn), boron (B), and arsenic (As). Wastewater treatment usually removes less than 50% of the metal content of the influent, leaving the effluent with significant metal loading. The sludge resulting from wastewater treatment is also rich in metals. Domestic wastewater and the dumping of domestic and industrial sludge are the major artificial sources of cadmium (Cd), chromium (Cr), copper (Cu), iron (Fe), lead (Pb), and mercury (Hg) pollution.

## **Metal Pollution from Stormwater Runoff**

Stormwater runoff from urbanized areas is a significant source of metal pollution in the receiving water streams. Metal composition of urban runoff water is dependent on many factors, such as city planning, traffic, road construction, land use, and the physical characteristics and climatology of the watershed.

## Metal Pollution from Industrial Wastes and Discharges

In general, the concentration of heavy metals in industrial effluents is much greater than their prescribed permissible limits in the aqueous solutions, so there is an urgent need to treat the metal containing effluents before they are discharged into the aquatic bodies. Metals and their concentrations in industrial waste discharges specifically depend on the profile of that particular industry.

*Table 1: The anthropogenic sources of heavy metals in the environment*

S. No.	Pollutant	Major sources
1.	<b>Arsenic</b>	Arsenic containing fungicides, pesticides and herbicides, metal smelters, byproducts of mining activities, chemical wastes
2	<b>Cadmium</b>	Cadmium producing industries, electroplating, welding. Byproducts from refining of Pb, Zn and Cu, fertilizer industry, pesticide manufacturers, cadmium–nickel batteries, nuclear fission plants.
3	<b>Chromium</b>	Metallurgical and chemical industries, processes using chromate compounds, cement and asbestos units
4	<b>Copper</b>	Iron and steel industry, fertilizer industry, burning of wood, discharge of mine tailings, disposal of fly ash, disposal of municipal and industrial wastes are the sources of copper in the atmosphere
5	<b>Iron</b>	Cast Iron, Wrought Iron, steel, alloys, construction, transportation, machine manufacturing
6	<b>Lead</b>	Automobile emissions, lead smelters, burning of coal and oil, lead arsenate pesticides, smoking, mining and plumbing
7	<b>Mercury</b>	Mining and refining of mercury, organic mercurial's used in pesticides, laboratories using mercury
8	<b>Nickel</b>	Metallurgical industries using nickel, combustion of fuels containing nickel additives, burning of coal and oil, electroplating units using nickel salts, incineration of nickel containing substances
9	<b>Zinc</b>	Zinc refineries, galvanizing processes, brass manufacture, metal plating, plumbing

## **Sanitary Landfills**

The metal contents and average concentrations of sanitary-landfill leachates are Cu (5 ppm), Zn (50 ppm), Pb (0.3 ppm), and Hg (60 ppb).

## **Agricultural Runoff**

The metal content of agricultural runoff originates in sediments and soils saturated by animal and plant residues, fertilizers, specific herbicides and fungicides, and use of sewage and sludge as plant nutrients.

## **Fossil Fuel Combustion**

Fossil fuel combustion is a major source of airborne metal contamination of natural waters.

## **2. REVIEW OF TRACE & TOXIC METALS**

Heavy metals are one of the most widespread causes of pollution both in water and the soil; Further, increasing levels of these metals concentration in the environment is causing serious concern in public opinion owing to the toxicity shown by most of them. Heavy metals are usually defined as metals with high atomic number, atomic weight and a density greater than 5.0 g/cm<sup>3</sup>, but in the literature it is possible to find so many different definitions. Recently, International Union of Pure and Applied Chemistry (IUPAC) defined the term "heavy metal" as a confusing and misleading one. Generally speaking, metals are natural components of the Earth's crust and some of them (e.g. copper, selenium, and zinc) are essential as trace elements to maintain the metabolism of the human body although at higher concentrations, they may show toxic effects. Many other metals (e.g. mercury, cadmium, lead, etc.) have direct toxic effects on human health. Owing to their chemical characteristics, metals remain in the environment, in many cases only changing from one chemical state to another one and eventually accumulating in the food chain. These pollutants enter the environment through a variety of human activities such as mining, refining and electroplating industries. The effluents produced by these industries contain a variety of heavy metals such as cadmium, copper, chromium, nickel, lead and zinc, subsequent release of these effluents into water bodies may significantly contribute to the increment in loads of toxic heavy metals in aquatic environments. Because of their high-water solubility, heavy metals can be easily absorbed by living organisms and, due to their mobility in natural water ecosystems and their toxicity to living forms, have been ranked as major inorganic contaminants in surface and ground waters. Even if they may be present in dilute, almost undetectable quantities, their recalcitrance to degradation and consequent persistence in water bodies imply that, through natural processes such as bio-magnification, their concentration may become elevated to such an extent that they begin exhibiting toxic effects. Out of the 35 metals considered dangerous for human health, 23 have been defined as heavy metals: antimony, arsenic, bismuth, cadmium, cerium, chromium, cobalt, copper, gallium, gold, iron, lead, manganese, mercury, nickel, platinum, silver, tellurium, thallium, tin, uranium, vanadium, and zinc. However, the major lethal effects to human health caused by these heavy metals are associated with exposure to lead, cadmium, mercury and arsenic (this element is a metalloid but it is usually defined as a heavy metal). Large amounts of any of these metals may cause acute or chronic toxicity (poisoning), resulting in damaged or reduced mental and central nervous functions, modify blood composition, damage the lung, kidney, liver, and other vital organs.

Long-term exposure to the above-mentioned heavy metals may result in slowly progressing physical, muscular, and neurological degenerative processes that mimic Alzheimer's disease, Parkinson's disease, muscular dystrophy and multiple sclerosis.

Allergies are not uncommon and repeated long-term contact with some metals or their compounds may even cause cancer. Heavy metals may enter the human body through food, water and air, or it may be absorbed through the skin when they enter into contact with humans in agriculture and in manufacturing, pharmaceutical, industrial or residential settings. Although several adverse health effects of heavy metals have been known since a long time, exposure to these metals is continuing and even increasing in some parts of the world. Thus, the control of heavy metal dumplings and the removal of toxic heavy metals from waters has become a challenge for the twenty-first century.

### **3. METAL TOXICITY:**

Important issues related to selected toxic metals like occurrences in nature, sources of water pollution, toxic effects etc. are described here under:

#### **Toxicity of Arsenic**

Arsenic is ubiquitous and ranks 20<sup>th</sup> in natural abundance, comprising about 0.00005% of the earth's crust, 14<sup>th</sup> in the seawater, and 12<sup>th</sup> in the human body (Mandal and Suzuki, 2002). Arsenic occurs in the environment in rocks, soil, water, air and in biota.

The element occurs in the environment in different oxidation states e.g. As as As(V), As(III), As(0) and As(-III). The chemical forms and oxidation states of arsenic are more important as regards to toxicity. Generally, inorganic forms are more toxic and mobile than organo-arsenic species, while arsenite is considered to be more toxic than arsenate. It has been reported that As(III) is 4 to 10 times more soluble in water than As(V) (Squibb and Fowler 1983; Xu et al. 1988; Lambe and Hill 1996; US EPA, 2002). Moreover, it has been found that As(III) is 10 times more toxic than As(V) and 70 times more toxic than Mono Methyl Arsonate {MMA(V)} and Di Methyl Arsinate {DMA(V)}. However, the trivalent methylated arsenic species, i.e., MMA(III) and DMA(III) have been found to be more toxic than inorganic arsenic because they are more efficient at causing DNA breakdown (Styblo et al. 2000; Dopp et al. 2004). Arsenic enters the human body through ingestion, inhalation or skin absorption. Most ingested and inhaled arsenic is well absorbed through the gastrointestinal tract and lung into the bloodstream.

People drinking arsenic contaminated water generally show arsenical skin lesions, which are a late manifestation of arsenic toxicity. Long term exposure to arsenic contaminated water may lead to various diseases such as conjunctivitis, hyperkeratosis, hyperpigmentation, cardiovascular diseases, disturbance in the peripheral vascular and nervous systems, skin cancer, gangrene, leucomelonisis, non pitting swelling, hepatomegaly and splenomegaly (Kiping, 1977; WHO, 2001; Pershagen, 1983). Chronic symptoms caused by a long exposure to As are unspecific (weight loss, chronic weakness) but a long exposure provokes arsenicosis, cardiovascular diseases, skin lesions among other organ function disorders (Bissen and Frimmel 2003). Arsenicosis is a chronic illness resulting from drinking water with high As level over a long period of time (Kapaj et al. 2006). The effects on the lungs, uterus, genitourinary tract and other parts of the body have been detected in the advance stages of arsenic toxicity. Besides, high concentrations of arsenic in drinking water also result in an increase in stillbirths and spontaneous abortions (Csanady and Straub, 1995).

#### **Toxicity of Cadmium**

Cadmium is an element that occurs naturally in the earth's crust. It is uniformly distributed in the Earth's crust, where it is generally estimated to be present at an average concentration of between 0.10 and 0.50 µg/L. Cadmium occurs in nature in the form of various inorganic compounds and as complexes with naturally occurring chelating agents; organo-cadmium compounds are extremely unstable and have not been detected in the natural environment. Cadmium is produced during extraction of zinc and is used in plating industry, pigments, in manufacture of plastic material, batteries and alloys. The water is contaminated with cadmium by industrial discharge, leaches from land filled area. Drinking water is generally contaminated with galvanized iron pipe, plated plumbing fitting of the water distribution pipes.

Cadmium ranks next to mercury in its toxicity. Exposure at low levels usually does not produce immediate health effects, but may cause severe health problems over long periods. The gastrointestinal tract is the major route of Cd uptake in both humans and animals. Cadmium is toxic to humans, animals, micro-organisms and plants, however only a small amount of cadmium intake is absorbed by the body and will be stored mainly in bones, liver and, in case of chronic exposure, in kidneys. In the last few years there have been some evidences that relatively low cadmium exposure may give rise skeletal damage due to low bone mineral density (osteoporosis) and fractures. The toxicity of the metal lies in that, after absorption, it accumulates in soft tissues. Animal tests have shown that cadmium may be a risk factor for cardiovascular disease (Jarup, 2003). For acute exposure, absorbed cadmium can cause symptoms such as salivation, difficulty in breathing, nausea, vomiting, a pain, anemia, kidney failure, and diarrhea. Inhalation of cadmium dust or smoke may cause dryness of the throat, headache, chest pain, coughing, increased uneasiness and bronchial complications (Lu et al., 2007). The adverse health effects caused by ingestion or inhalation of Cd include renal tubular dysfunction due to high urinary Cd excretion, high blood pressure, lung damage and lung cancer.

Furthermore, cadmium accumulation in animals and humans occurs throughout their life spans. The sites of greatest cadmium accumulation are the liver and kidney. After inhalation or absorption from the gastrointestinal, cadmium is concentrated in the kidney, where its half-life may exceed 10 to 20 years. One of the most widely known toxic effects manifested by Cd poisoning is nephro-toxicity. Adverse renal effects are more commonly seen with exposure to low levels of Cd. The effects are manifested by excretion of low-molecular-weight plasma proteins, such as  $\beta$ 2-microglobulin and retinol-binding protein (RBP). -The widely reported Cd poisoning ***itai-itai byo*** episode occurred in Japan after World War II. In Japan cadmium from mining and refinery factories polluted Jinzo River water which was used for irrigation purpose. The rice grown on such cadmium accumulated fields, which the humans consumed through water and food chain affected by ostomolacia and skeletal deformation. There was sever pain in body and joints and the people cried *ITAI – ITAI* (it hurts-it hurts).

## Toxicity of Chromium

Chromium can exist in valencies from -2 to 6 but it present in the environment mainly as trivalent or hexavalent state. Trivalent chromium (Cr [III]) is the most common naturally occurring state; most soils and rocks contain small amounts of chromic oxide ( $\text{Cr}_2\text{O}_3$ ). Hexavalent chromium (Cr[VI]) occurs frequently in nature as chromates ( $\text{CrO}_4^{2-}$ ) and dichromates ( $\text{Cr}_2\text{O}_7^{2-}$ ) which are generally obtained from industrial and domestic emissions. Chromium is considered as an essential nutrient and a health hazard because Cr exists in more than one oxidation state. Specifically, Cr in oxidation state +6, written as Cr(VI), is considered harmful even in small intake quantity (dose) whereas Cr in oxidation state +3, written as Cr(III), is considered essential for good health in moderate intake. Chromium (III) is an essential nutrient for humans and shortages may cause heart conditions, disruptions of metabolisms and diabetes. Trivalent chromium is necessary for the synthesis of fat from glucose and also for the oxidation of fat to carbon dioxide. But the uptake of too much chromium (III) can cause health effects as well, for instance skin rashes.

People who smoke tobacco also have a higher chance of exposure to chromium. Chromium (VI) is known to cause various health effects. When it is a compound in leather products, it can cause allergic reactions, such as skin rash. After breathing in, chromium (VI) can cause nose irritations and nosebleeds. Other health problems that are caused by chromium (VI) are:

- Skin rashes

- Upset stomachs and ulcers
- Respiratory problems
- Weakened immune systems
- Kidney and liver damage
- Alteration of genetic material
- Lung cancer
- Death

The health hazards associated with exposure to chromium are dependent on its oxidation state. The metal form (chromium as it exists in this product) is of low toxicity and the hexavalent form is toxic. Adverse effects of the hexavalent form on the skin may include ulcerations, dermatitis, and allergic skin reactions. Inhalation of hexavalent chromium compounds can result in ulceration and perforation of the mucous membranes of the nasal septum, irritation of the pharynx and larynx, asthmatic bronchitis, bronchospasms and edema. Respiratory symptoms may include coughing and wheezing, shortness of breath and nasal itch.

Hexavalent chromium is toxic to plants and animals. It causes yellowing of leaves of wheat and paddy. Maximum permissible limit of chromium in drinking water as recommended by WHO is 0.05 mg/L.

## Toxicity of Copper

Copper is an essential micronutrient (Underwood 1977; Goyer 1991). The Food and Nutrition Board (FNB) recommends dietary copper intake for adults of 1.53 mg/day (NRC, 1989). Three major valence states: copper metal Cu(0), Cu(I) and Cu(II). Copper is commonly found in ores. Copper occurs in nature as the metal and in minerals, most commonly cuprite ( $\text{Cu}_2\text{O}$ ) and malachite ( $\text{Cu}_2\text{CO}_3(\text{OH})_2$ ). The principal copper ores are sulphides, oxides, and carbonates.

Copper is both essential and toxic to living systems. As an essential metal, copper is required for adequate growth, cardiovascular integrity, lung elasticity, neovascularization, neuroendocrine functions, and iron metabolism. An average adult human ingests about 1 mg of copper per day in the diet; about half of which is absorbed (Harris 1997). Copper is obligatory for enzymes involved in aerobic metabolism, such as cytochrome oxidase in the mitochondria, lysyl oxidase in connective tissue, dopamine mono-oxygenase in brain, and ceruloplasmin. As a co-factor for apo-copper-zinc superoxide dismutase (apoCuZnSOD), copper protects against free-radical damage to proteins, membrane lipids, and nucleic acids in a wide range of cells and organs.

Severe copper deficiencies, either gene defects due to mutations or low dietary copper intakes, although relatively rare in humans, have been linked to mental retardation, anemia, hypothermia, neutropenia, diarrhea, cardiac hypertrophy, bone fragility, impaired immune function, weak connective tissue, impaired central-nervous-system (CNS) functions, peripheral neuropathy, and loss of skin, fur (in animals), or hair color (Linder and Goode 1991; Uauy et al. 1998; Cordano 1998; Percival 1998).

Long-term exposure to copper can cause irritation of the nose, mouth and eyes and it causes headaches, stomachaches, dizziness, vomiting and diarrhea. Intentionally high uptakes of copper may cause liver and kidney damage and even death. Whether copper is carcinogenic has not been determined yet. There are scientific articles that indicate a link between long-term exposure to high concentrations of copper and a decline in intelligence with young adolescents.

Whether this should be of concern is a topic for further investigation. Industrial exposure to copper fumes, dusts, or mists may result in metal fume fever with atrophic changes in nasal mucous membranes. Chronic copper poisoning results in *Wilson's Disease*, characterized by a hepatic cirrhosis, brain damage, demyelination, renal disease, and copper deposition in the cornea.

Excess amount of copper sulphate also shows detrimental effect on botanical environment. Copper in ionic form is very toxic to the photosynthesis of the green algae, Chlorella pyrenoidosa and the diatom, Nitzchiz palea in concentrations of copper normally found in natural waters. Copper accumulates progressively in soils where copper fungicides are used, particularly in vineyards and orchards, which are spread repeatedly. Thus, it is seen that though copper is essential of life and health, its deficiency or excesses both cause adverse effects.

### Toxicity of Iron

Iron is essential to almost all living things, from micro-organisms to humans. Iron is the fourth most abundant element in the earth's crust and the most abundant heavy metal; it is present in the environment mainly as Fe (II) or Fe (III). Iron is generally present in surface waters as salts containing Fe (III) when the pH is above 7. Most of those salts are insoluble and settle out or adsorbed onto surfaces; therefore, the concentration of iron in well-aerated waters is seldom high. Under reducing conditions, which may exist in groundwater, some lakes or reservoirs, and in the absence of sulphide and carbonate, high concentrations of soluble Fe(II) may be found. The presence of iron in natural waters can be attributed to the weathering of rocks and minerals, acidic mine water drainage, landfill leachates, sewage effluents and iron-related industries.

Iron, an essential element in human nutrition, is an integral component of cytochromes, porphyrins and metalloenzymes. Dietary iron requirements vary according to sex and age; older infants, children and women of menstrual age are most vulnerable to iron deficiency. Iron is an essential constituent in plant metabolism. It is indispensable for the synthesis of chlorophyll in green plants, although it does not enter in the constituent of the chlorophyll molecules. Most of the iron in plants is present as a constituent of organic molecules, enzymes and carries catalase, peroxide and cyto-chromes which play important role in cellular metabolism. Iron is indispensable for the synthesis of chlorophyll molecules. Deficiency of iron in plants causes chlorosis. It is one of the most immobile elements in plants.

Iron is also widely distributed in human body where it exists in the ionic (loosely bound, inorganic iron) and nonionic (tightly bound organic form) state. It is also a constituent of hemoglobin molecule. It is more often suggested that iron deficiency predispose children to lead poisoning. Deficiency of iron with other trace elements is the cause of pica (a morbid appetite for unusual or unfit food, as clay, chalk, ashes, bricks etc., showing itself especially in hysteria, pregnancy and chlorosis). Iron deficiency also affects the transport of lead to the tissue. According to Dr. Ronald Hoffman, depending upon the age, sex and body weight, minimum daily requirement of iron varies from 6 mg/day to 30 mg/day. Following are the recommendations for intakes of iron, according to Dr. Hoffman:

- Infants upto 6 months require 6 mg/day.
- From 6 months to 1 year, 10 mg/day is required.
- Children age 1 to 10 years, require 10 mg/day.
- Males age 11 to 18 years, require 12 mg/day.
- Males age 19 to 51+ years, require 10 mg/day.

- Females age 11 to 50 years, require 15 mg/day.
- Females over 51 years, require 10 mg/day.
- Pregnant women require 30 mg/day.
- Lactating women require 15 mg/day.

Thus while normal amount of iron is essential, the normally large amount adversely affects the human system, which may result in haemochromatosis. Iron absorption is enhanced by heme, ascorbic acid, amino acids and inhibited by tannins, calcium, phosphate, phytic acid and fibers. Although the human body contains only about 0.004% iron, this element plays a central role in the life processes. As a constituent of the respiratory pigment haemoglobin, iron is essential for the functioning of every organ and tissue of the human body. Over half of the iron is present in the form of haemoglobin; the remaining iron is stored mainly in the liver. Nutritional anaemia is one of the most prevalent deficiency diseases throughout the world. Although anaemia may result from many different causes, the form most frequently encountered is iron deficiency anaemia (Tsai, 1975). Anaemia is a major health problem in India, with over half of ever-married woman having the condition. The problem clearly requires immediate attention and intervention.

Iron usually exists in natural water both in ferric and ferrous form. The form of iron however may be altered as a result of oxidation or reduction due to the growth of bacteria in the water during storage, usually the ferric form is predominant in the most of the natural waters. Iron in water may be either in true solution or in a colloidal state or in the form of relatively coarse suspended particles. The iron determination is helpful in assessing the extent of corrosion and aiding in the solution of these problems. Research on corrosion and methods of corrosion control requires the use of many types of tests to evaluate the extent of metal loss. The most important one of them is the iron determination (Sawyer, 1978). In drinking water 0.3 mg/L is the highest desirable limit and 1 mg/L the maximum permissible limit of iron in absence of alternative sources.

### **Toxicity of lead**

Lead is the most common in the heavy elements. Several stable isotopes exist in nature, <sup>208</sup>Pb being the most abundant. Lead is used mainly in the production of lead-acid batteries, solder and alloys. The organo-lead compounds tetraethyl and tetramethyl lead have also been used extensively as antiknock and lubricating agents in petrol, although their use for these purposes in many countries is being phased out. Owing to the decreasing use of lead containing additives in petrol and of lead containing solder in the food processing industry, concentrations in air and food are declining, and intake from drinking water constitutes a greater proportion of total intake.

Lead toxicity has been known for over two thousand years. The early Greeks used Pb as a glazing for ceramic pottery and became aware of its harmful effects when it was used in the presence of acidic foods. Researchers suggest that some Roman emperors became ill and even died as a result of Pb poisoning from drinking wines contaminated with high levels of Pb.

Lead is found in all human tissues and organs though it is not needed nutritionally. It is known as one of the systemic poisons because, once absorbed into the circulation it will distribute throughout the body, where it affects various organs and tissues. It inhibits hematopoiesis (formation of blood or blood cells) because it interferes with heme synthesis, and Pb poisoning may cause anaemia. Pb also affects the kidneys by inducing renal tubular dysfunction. This, in turn, may lead to secondary effects. Effects of Pb on the gastrointestinal tract include nausea,

anorexia, and severe abdominal cramps (lead colic) associated with constipation. Pb poisoning is also manifested by muscle aches and joint pain, lung damage, difficulty in breathing, and diseases such as asthma, bronchitis, and pneumonia. Pb poisoning can also damage the immune system, interfering with cell maturation and skeletal growth. Pb can pass the placental barrier and may reach the fetus, causing miscarriage, abortions and stillbirths.

According to the CDC, lead poisoning is the most common and serious environmental disease affecting young children. Children are much more vulnerable to Pb exposure than adults because of their more rapid growth rate and metabolism. Pb absorption from the gastrointestinal tract in children is also higher than in adults (25% vs. 8%), and ingested Pb is distributed to a smaller tissue mass. Children also tend to play and breathe closer to the ground, where Pb dust concentrates. One particular problem has been the Pb poisoning of children who ingest flakes of lead-based paint. This type of exposure accounts for as much as 90% of childhood Pb poisoning. The main health concern in children is retardation and brain damage. High exposure may be fatal.

Plants grown in lead mining area are known to accumulate high levels of lead. Plants near highways accumulate atmospheric dust containing Pb as foliar deposits, from the combustion of petrol as well as absorb it from soil.

### Toxicity of Nickel

Nickel is the 24<sup>th</sup> most abundant element (twice as Cu) and comprises approximately 0.008% of the content of the earth's crust; hence, it is a natural component of soil (parent material) and water (Alloway 1995; Hostynék and Maibach 2002; Hedfi et al. 2007). It is the 5<sup>th</sup> most abundant element in the biosphere, Ni was only discovered through the mining of other metals. Its principal ores are nickelite (NiAs), millerite (NiS), and pentlandite ([Ni, Fe]S).

Nickel is released into the environment from a variety of natural and anthropogenic sources. Among industrial sources, a considerable amount of environmental Ni derives from the combustion of coal, oil, and other fossil fuels. Other industrial sources that contribute to nickel emissions are mining and refining processes, nickel alloy manufacturing (steel), electroplating, and incineration of municipal wastes (Sharma 2005; Ensink et al. 2007). Wastewater from municipal sewage treatment plants also contributes to environmental metal accumulation (van der Hoek et al. 2002).

In small quantities nickel is essential, but when the uptake is too high it can be a danger to human health. Humans may be exposed to nickel by breathing air, drinking water, eating food or smoking cigarettes. Skin contact with nickel-contaminated soil or water may also result in nickel exposure. The most common type of Ni exposure for the public is through direct skin contact with Ni plating. Ni(CO)<sub>4</sub> gas is the most toxic out of the Ni compounds and it is the first to cause deaths in refineries. The immediate symptoms included headaches, nausea, weakness, dizziness, vomiting, and epigastric pain. There was a latency period of 1 to 5 days, followed by secondary symptoms which included chest constriction, chills and sweating, shortness of breath, coughing, muscle pains, fatigue, gastrointestinal discomfort and in severe cases, convulsions and delirium.

Nickel fumes are respiratory irritants and may cause pneumonitis. Exposure to nickel and its compounds may result in the development of a dermatitis known as "nickel itch" in sensitized individuals. The first symptom is usually itching, which occurs up to 7 days before skin eruption occurs. The primary skin eruption is erythematous or follicular which may be followed by skin ulceration. Nickel sensitivity once acquired appears to persist indefinitely. High level occupational

exposure has been associated with renal problems, vertigo and dyspnoea (Commission of European Communities, 1976). Nickel and certain nickel compounds have been listed by the National Toxicology Program (NTP) as being reasonably anticipated to be carcinogens. The International Agency for Research on Cancer (IARC) has listed nickel compounds within group 1 (there is sufficient evidence for carcinogenicity in humans) and nickel within group 2B (agents which are possibly carcinogenic to humans).

### Toxicity of Zinc

Zinc is the twenty-fifth most abundant element. It is widely found in nature and makes up 0.02% by weight of the earth's crust (Budavari, 1989). Zinc normally appears dull grey owing to coating with an oxide or basic carbonate. It is extremely rare to find zinc metal free in nature (Beliles, 1994). The major source of zinc is sphalerite, smithsonite, hemimorphite and franklinite. The largest natural emission of zinc to water results from erosion. Natural inputs to air are mainly due to igneous emissions and forest fires. Anthropogenic and natural sources are of a similar magnitude. The main anthropogenic sources of zinc are mining, zinc production facilities, iron and steel production, corrosion of galvanized structures, coal and fuel combustion, waste disposal and incineration, and the use of zinc-containing fertilizers and pesticide

Zinc is an essential element for both animals and man which is necessary for the functioning of various enzyme systems. Nutritional zinc deficiency in humans has been reported in a number of countries. In Egypt endemic zinc deficiency syndrome among young men has been reported (Prasad, et al., 1961; Halsted et al., 1972). This syndrome having characters of retarded growth, signs of immaturity and anemia is probably caused by low intestinal absorption of zinc. Its complete cure was observed by administration of large doses of zinc sulfate.

Acute toxicity arises from the ingestion of excessive amounts of zinc salts, either accidentally or deliberately as an emetic or dietary supplement. Vomiting usually occurs after the consumption of more than 500 mg of zinc sulfate. Mass poisoning has been reported following the drinking of acidic beverages kept in galvanized containers; fever, nausea, vomiting, stomach cramps and diarrhea occurred 3–12 h after ingestion. Food poisoning attributable to the use of galvanized zinc containers in food preparation has also been reported; symptoms occurred within 24 h and included nausea, vomiting, and diarrhea, sometimes accompanied by bleeding and abdominal cramps.

Symptoms of zinc toxicity in humans include vomiting dehydration, electrolyte imbalance, abdominal pain, nausea lethargy, dizziness and lack of muscular co-ordination (Prasad and Oberleas, 1976). Acute renal failure caused by zinc chloride has also been reported (Csata, 1968). Zinc unlike Hg, Pb or Cd is an essential trace element for organism and plays a vital role in the physiological and metabolic processes of many organisms. However, zinc can be toxic to the organisms in high concentrations.

Zinc is an essential trace element for plants and animals including human begins and it plays vital role in metabolic processes. The most common effect of zinc poisoning in human are non fatal 'metal fume' fever caused by inhalation of zinc oxide fumes and illness arising from the ingestion of acidic foods prepared in zinc galvanized containers. Particularly, zinc chloride in Zn salts produce dermatitis upon contact with the skin.

## **4. WATER QUALITY CRITERIA**

As it is a well-known fact that the sources of usable water on the earth are limited, any kind of pollution in such sources will further reduce its availability. Polluted water cannot be utilized for drinking because of its inherent health risk. Water with high salt contents is not suitable for agriculture and most industries. The quality of water also interferes with the aesthetic and economic pursuits of water bodies by affecting marine and fresh water life. However, the water which is not suitable for irrigation may be quite suitable for industrial cooling. Every use of water requires a certain minimum quality standard with regards to the presence of dissolved and suspended materials of both chemical and biological nature. The desirable quality of water ensures no harm to the user.

To maintain the minimum quality standard for diverse user has led to the formulation of water quality criteria and water quality standards. Water quality criteria can be considered as specific requirements on which a decision or judgment to support a particular use will be based. The criteria for the various uses are developed based on the experimental data and our current knowledge of the health, ecology and other issues and assessing its overall economical effect these are not a set of fixed values, but subject to modification as the scientific data get updated and more and more knowledge is gathered. The term standard applies to any definite principle or measure established by an authority by limiting concentration of different constituents in water to ensure the safe use of water and safeguard the environment.

### **Drinking Water Standards**

In view of the direct consumption of water by human beings, the domestic water supply is considered to be most important use of water and drinking use has been given first priority on utilization of water resource in the National Water Policy. In India, agencies like the Bureau of Indian Standards (BIS) and Indian Council of Medical Research (ICMR) have formulated drinking water standards. The World Health Organization (WHO) has also laid down drinking water standards, which are considered as international standards. Drinking water standards for trace and toxic metals according to BIS code 10500:2012 are given below in Table 2.

**Table 2: Drinking Water Standards for Trace & Toxic metals (BIS-10500:2012)**

S.No.	Toxic metal	Requirement (Acceptable Limit )		Permissible Limit in the Absence of Alternative Source	
		(mg/L)	(µg/L)	(mg/L)	(µg/L)
1	Total arsenic as As	0.01	10	0.05	50
2	Cadmium as Cd	0.003	3	No relaxation	
3	Total Chromium as Cr	0.05	50	No relaxation	
4	Copper as Cu	0.05	50	1.5	1500
5	Iron as Fe	0.30	300	No relaxation	
6	Lead as Pb	0.01	10	No relaxation	
7	Nickel as Ni	0.02	20	No relaxation	
8	Zinc as Zn	5	5000	15	15000

## Regulatory Limits of Heavy Metals US Environmental Protection Agency (US EPA)

Several types of toxic heavy metals frequently pollute surface water bodies and their maximum permissible limits according to WHO and US EPA are presented in Table 3. These limits are mandatory for all water supply systems. Naturally occurring water (both surface and groundwater) frequently contains some of these heavy metals at concentrations 100 or 1000 times more than the prescribed MCL values. Since these heavy metals are valuable resources for different industrial applications, their removal, recovery and recycling assume greater significance.

**Table 3: Maximum acceptable limits of several toxic heavy metal ions in the surface waters based on WHO and US EPA regulations.**

Heavy Metal	Toxicity rank	WHO (µg/L)	USEPA (µg/L)
<b>Arsenic</b>	1	10	10
<b>Lead</b>	2	10	15
<b>Mercury</b>	3	1	2
<b>Cadmium</b>	8	3	5
<b>Chromium</b>	17	50	100
<b>Nickel</b>	57	70	100
<b>Zinc</b>	75	NGL	5000
<b>Copper</b>	125	2000	1300
<b>Iron</b>	-	-	300
<b>Note : NGL = NO Guideline</b>			

In accordance with toxicity data obtained from human clinical investigations, and various other studies such as animal experiments, drinking water standards have been proposed by various governmental bodies. A brief summary is given in Table 4 compiled by Hattingh, 1977.

**Table 4: Drinking water quality criteria for trace metals which might affect public health**

Parameter (unit- µg/L)	USPHS (1962)	Japan (1968)	USSR (1970)	WHO European (1970)	WHO Intern. (1971)	SABS (1971)	NAS (1972)	Australia (1973)	US EPA (1975)	FRG (1975)	BIS 10500:2012
<b>Arsenic</b>	10	50	50	50	50	50	100	50	50	40	10
<b>Barium</b>	1,000	-	4,000	1,000	-	-	1,000	1,000	1,000	-	700
<b>Cadmium</b>	10	-	10	10	10	50	10	10	10	6	3
<b>Chromium</b>	50	50	100	50	-	50	50	50	50	50	50
<b>Copper</b>	1,000	10,000	100	50	50	1,000	1,000	10,000	-	-	50
<b>Lead</b>	50	100	100	100	100	50	50	50	50	40	10
<b>Mercury</b>	-	1	5	-	1	-	2	-	2	4	1
<b>Selenium</b>	10	-	1	10	10	-	10	10	10	8	10
<b>Silver</b>	50	-	-	-	-	-	-	50	50	-	100
<b>Zinc</b>	5,000	100	1,000	5,000	5,000	5,000	5,000	5,000	-	2,000	5000

World Health Organisation (WHO)

US Public Health Service (USPHS)

South African Bureau of Standards (SABS)

Russia (USSR)

USA National Academy of Sciences (NAS)

Australia, Japan and Environmental Protection Agency (EPA) of the USA

Finally, it is worth noting that maximum permissible concentrations (USSR) and threshold limit values (US) have been established within the field of occupational hygiene (Roschin and Timofeevskaya, 1975). These values pertain to the control of occupational exposure with regard to airborne particulates. In consequence, they are of no relevant importance in the present context.

### **Quality Criteria for Livestock**

A safe water supply is essential for healthy livestock. Contaminated water can affect growth, reproduction and productivity of animals as well as safety of animal products for human consumption. Contaminated water supplies for livestock and poultry can also contaminate human drinking water. For these reasons, farm water supplies should be protected against contamination from bacteria, nitrates, sulfates, and pesticides. The Environmental Protection Agency has set drinking water standards for human consumption, but no set of standards exists for drinking water for livestock or poultry. However, The National Academy of Science has recommended maximum levels for some contaminants.

The permissible daily intake of substances is greatly dependent on the concentration of the substances and the quality of water ingested. The daily water requirement of animals vary with a number of factors such as temperature and humidity, the water content in the food, the degree of exertion of the animal and the salinity of the water supply. Therefore, the recommended concentrations of specific substance are based on typical usage.

Excessive salinity in livestock drinking water can upset the animals' water balance and cause even death. High levels of specific ions in water can cause animal health problems and death. The National Academy of Sciences offers upper limits for toxic substances in water (Table 5).

**Table 5: Recommendations for levels of toxic substances in drinking water for livestock**

Sr.	Toxic metal	Upper Limit in mg/L	Sr.	Toxic metal	Upper Limit in mg/L
1.	Arsenic	0.2	5.	Iron as Fe	-
2.	Cadmium as Cd	0.05	6.	Mercury as Hg	0.01
3.	Chromium as Cr	1.0	7.	Zinc as Zn	24
4.	Copper as Cu	0.5

### **Water Quality for Irrigation**

Nearly all waters contain dissolved salts and trace elements, many of which results from the natural weathering of the earth's surface. In addition, drainage waters from irrigated lands and effluent from city sewage and industrial waste water can impact water quality. In most irrigation situations, the primary water quality concern is salinity levels, since salts can affect both the soil structure and crop yield. However, a number of trace elements are found in water which can also limit its use for irrigation.

The required quality of Irrigation water varies substantially, depending upon the salinity, soil permeability, toxicity and some miscellaneous concerns such as excessive nitrogen loading or unusual pH of water. Some elements in irrigation water may be directly toxic to crops. Establishing toxicity limits in water is complicated by reactions which take place once the water is applied to the soil. When an element is added to the soil from irrigation, it may be inactivated by chemical reactions or it may build up in the soil until it reaches a toxic level. An element at a given concentration in water may be immediately toxic to a crop because of foliar effects if sprinkler irrigation is used. If furrow irrigation is used, it may require a number of years for the element to accumulate to toxic levels, or it may be immobilized in the soil and never reach toxic levels. The recommended water quality for irrigation is shown in Table 6.

**Table 6: Recommended limits for constituents in reclaimed water for irrigation.**

Constituent	Long-term use (mg/L)	Short-term use (mg/L)	Remarks
Aluminum (Al)	5.00	20	Can cause nonproductivity in acid soils, but soils at pH 5.5 to 8.0 will precipitate the ion and eliminate toxicity.
Arsenic (As)	0.10	2.0	Toxicity to plants varies widely, ranging from 12 mg/L for Sudan grass to less than 0.05 mg/L for rice.
Beryllium (Be)	0.10	0.5	Toxicity to plants varies widely, ranging from 5 mg/L for kale to 0.5 mg/L for bush beans.
Boron (B)	0.75	2.0	Essential to plant growth, with optimum yields for many obtained at a few-tenths mg/L in nutrient solutions. Toxic to many sensitive plants (e.g., citrus) at 1 mg/L. Most grasses relatively tolerant at 2.0 to 10 mg/L.
Cadmium (Cd)	0.01	0.05	Toxic to beans, beets, and turnips at concentrations as low as 0.1 mg/L in nutrient solution. Conservative limits recommended.
Chromium (Cr)	0.1	1.0	Not generally recognized as essential growth element. Conservative limits recommended due to lack of knowledge on toxicity to plants.
Cobalt (Co)	0.05	5.0	Toxic to tomato plants at 0.1 mg/L in nutrient solution. Tends to be inactivated by neutral and alkaline soils.
Copper (Cu)	0.2	5.0	Toxic to a number of plants at 0.1 to 1.0 mg/L in nutrient solution.
Fluoride (F)	1.0	15.0	Inactivated by neutral and alkaline soils.
Iron (Fe)	5.0	20.0	Not toxic to plants in aerated soils, but can contribute to soil acidification and loss of essential phosphorus and molybdenum.
Lead (Pb)	5.0	10.0	Can inhibit plant cell growth at very high concentrations.
Lithium (Li)	2.50	2.50	Tolerated by most crops at up to 5 mg/L; mobile in soil. Toxic to citrus at low doses recommended limit is 0.075 mg/L.
Manganese (Mg)	0.2	10.0	Toxic to a number of crops at a few-tenths to a few mg/L in acid soils.
Molybdenum (Mo)	0.01	0.05	Nontoxic to plants at normal concentrations in soil and water. Can be toxic to livestock if forage is grown in soils with high levels of available molybdenum.
Nickel (Ni)	0.2	2.0	Toxic to a number of plants at 0.5 to 1.0 mg/L; reduced toxicity at neutral or alkaline pH.
Selenium (Se)	0.02	0.02	Toxic to plants at low concentrations and to livestock if forage is grown in soils with low levels of added selenium.
Vanadium (V)	0.1	1.0	Toxic to many plants at relatively low concentrations.
Zinc (Zn)	2.0	10.0	Toxic to many plants at widely varying concentrations; reduced at increased pH (6 or above) and in fine textured or organic soils.

## **5. METHODOLOGY**

Living organisms require trace amounts of some metals including cobalt, copper, iron, manganese, molybdenum, vanadium, strontium and zinc. Excessive levels of these essential metals are detrimental to the organisms. Non-essential metals like cadmium, chromium, mercury, lead, arsenic and antimony are of more concern to surface water system because these metals produce undesirable effects on human and animal life. Once these metals enter into the system, they remain for relatively longer periods. Once absorbed, inorganic metals are capable of reacting with a variety of binding sites in the human body and have strong attraction to biological tissues. Natural water contains toxic metals in traces. Industrial wastes containing metals have aggravated the problem of metal pollution. Electroplating, metallurgical industry, galvanising plants, tanneries and thermal power stations are few of the major contributors of metal pollution in surface water. All metals exist in surface water in colloidal, particulate and dissolved forms, although dissolved concentrations are generally low. The soluble forms are generally ions or unionized, organo-metallic chelates or complexes. The solubility of trace metals in surface water is predominately controlled by pH, the type and concentration of legends on which the metal can absorb and the oxidation state of the mineral components.

### **Metal Detection Techniques**

The analytical methods commonly used in estimation of heavy metals in water and waste waters are:

- Inductively coupled plasma analyser (ICP)
- Atomic absorption spectrophotometry (AAS)
- Colorimetric methods
- Polarographic estimation
- Ion Selective Electrodes (ISE)

Inductively coupled plasma (ICP) techniques and atomic absorption spectrophotometry are applicable over a broad linear range and are especially sensitive for refractory elements. In general, detection limits for ICP methods are higher than AAS. Colorimetric methods are applicable when interferences are known to be within the limit of the particular method. Extreme care should be taken in sampling and analysis to prevent contamination.

### **Chemicals and Reagents**

All chemicals and reagents used in the chemical analysis during the study were of analytical reagent grade (Merck). Standard solutions of metals ions were procured from Merck, Germany. De-ionized water was used throughout the study. All glassware and containers used were thoroughly cleaned by soaking in detergent followed by soaking in 10% nitric acid for 48hrs and finally rinsed with de-ionized water several times prior to use.

### **Method**

In the present study, samples were collected in polyethylene containers. These water samples were prepared for the determination of heavy metals, viz., arsenic, cadmium, chromium, copper, iron, lead, nickel and zinc by atomic absorption spectrophotometer. The study was carried out on Agilent 240FS atomic absorption spectrophotometer by graphite tube analyzer (GTA) using argon gas and Iron analyzed by flame operation using air and acetylene gas. The

wavelength, current, slit and method employed using atomic absorption spectrophotometer is given in Table 7.

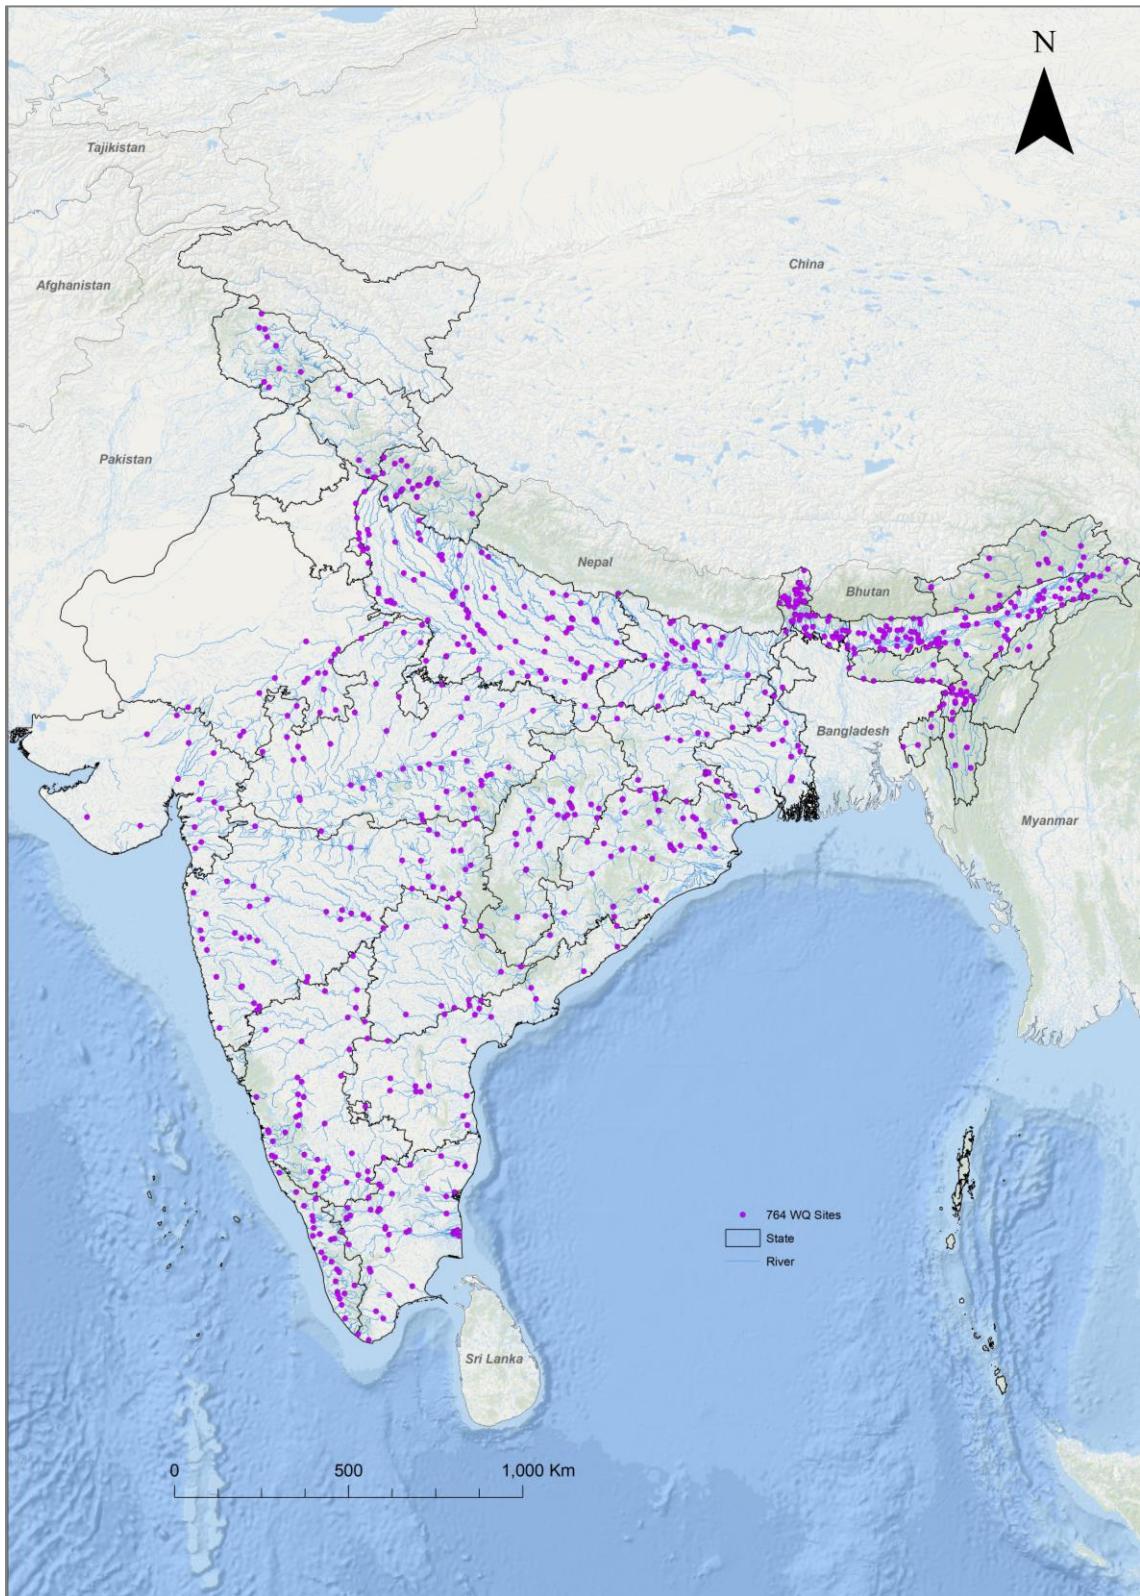

**Table 7: The wavelength, current, slit and method used for chemical analysis by AAS**

Sr.	Parameter	Wave length (nm)	Current (mA)		Slit (nm)	Method used for analysis
			Recommended	Maximum		
1	<b>Arsenic</b>	193.7	10	12	0.5	By AAS with VGA

## 6. RIVER WATER MONITORING BY CWC

Presently, Central Water Commission (CWC) is monitoring river water quality at its 652 key hydrological observation stations covering all the important river basins of India. Also, water quality samples are being collected from 112 water quality sampling stations (Figure 1 and Table 8).

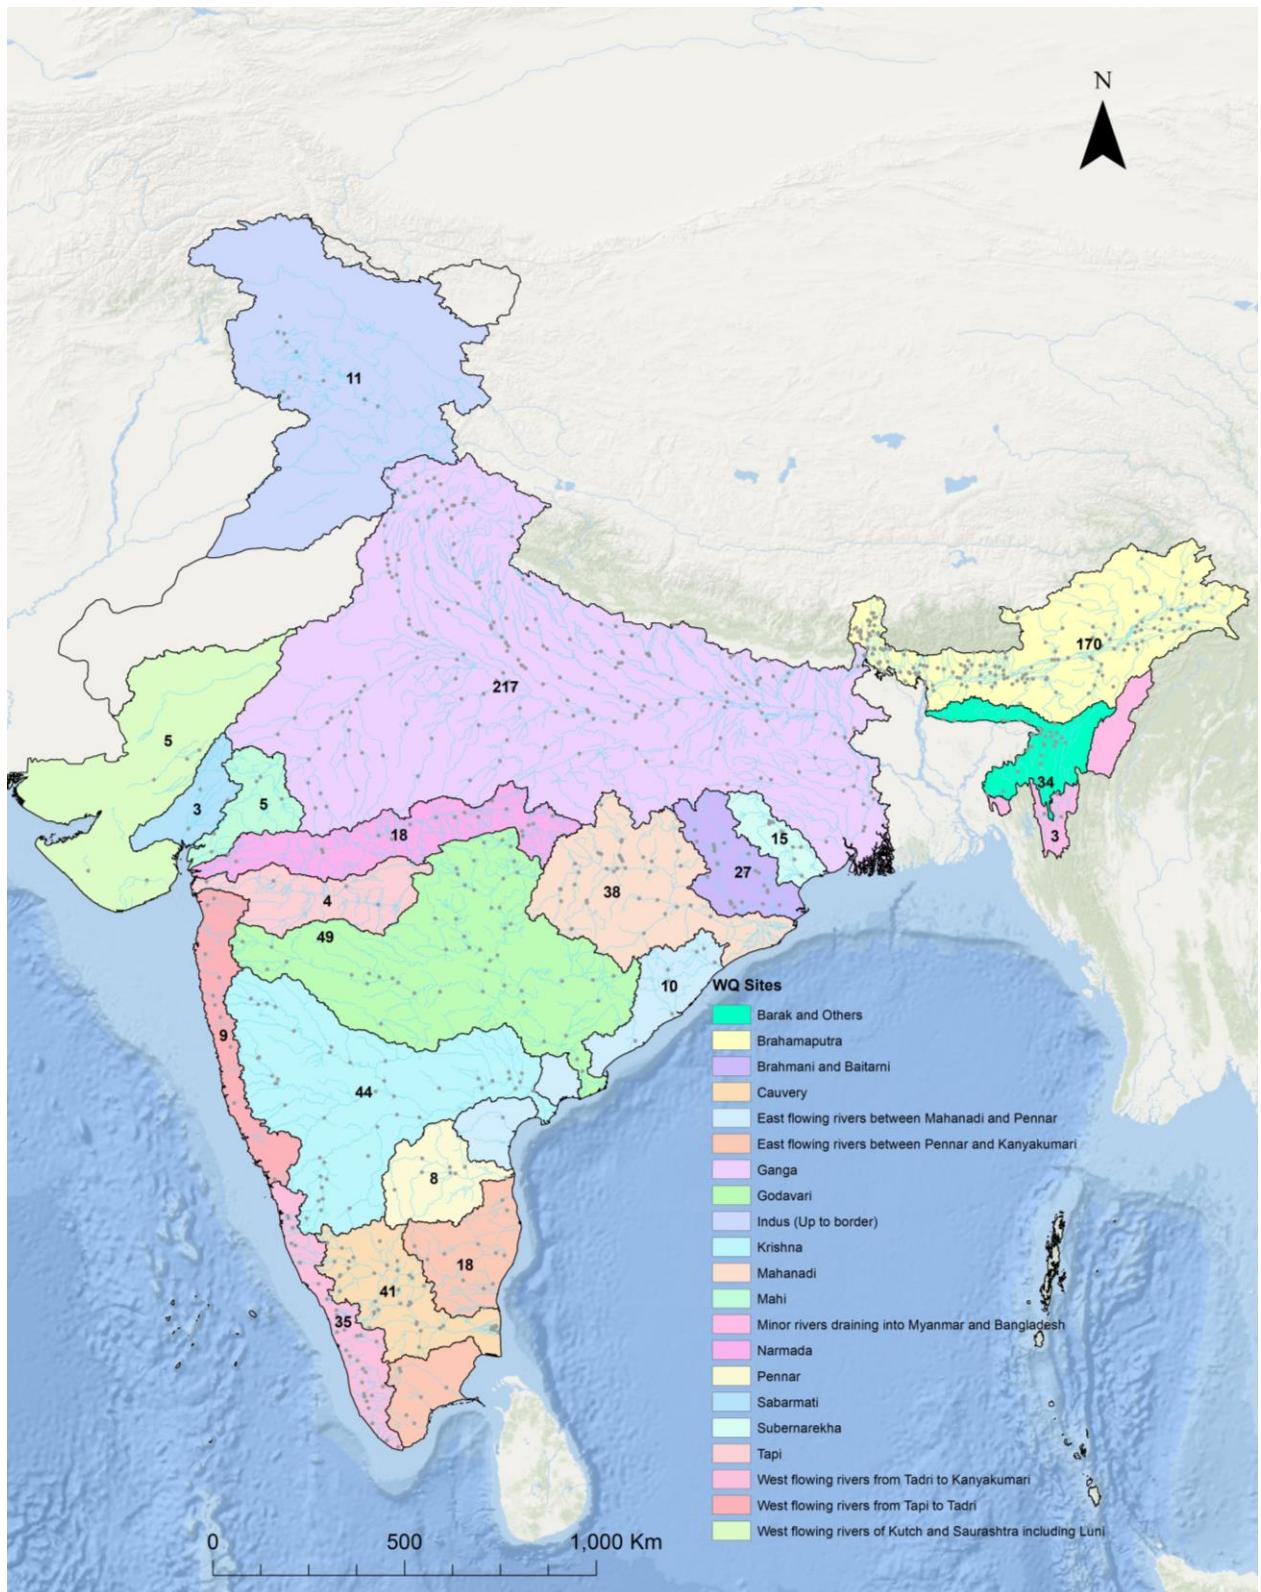

*Figure 1: Water quality network of CWC*

Further, CWC is planning to increase the water quality network on Indian rivers by considering future objectives and necessities, to cover all rivers in the country. The basin-wise and state-wise water quality stations monitored by Central Water Commission as on Sep 2020 are depicted in Figure 2 and Figure 3. Details are given in Table 9 and Table 10 respectively.

CWC is maintaining a three-tier laboratory system for analysis of the physio-chemical parameters of the water. The Level-I laboratories are located at 378 field water quality monitoring stations on major rivers of India where physical parameters such as temperature, colour, odour, specific conductivity, pH and dissolved oxygen of river water are observed. There are 18 Level-II laboratories located at selected division offices throughout India to analyses 25 nos. of physio-chemical and bacteriological parameters of water. 5 Level-III laboratories are functioning at Varanasi, Delhi, Hyderabad, Coimbatore, and Guwahati where 41 parameters including heavy metals / toxic parameters and pesticides are analysed. Out of 23, 16 laboratories of CWC have got accreditation by National Accreditation Board for Testing and Calibration Laboratories (NABL) in accordance with Standard ISO/IEC 17025:2017, map of which are given in **Figure 4**.

**Figure 4: Water quality laboratories of CWC**

## 7. STUDY AREA

There are 764 water quality monitoring stations across India (as on 01.01.2021). Out of which, a total number of 688 water quality stations covering all the major River Basins in India right from East to West and North to South were studied for Trace and Toxic metals during Aug 2018 to Dec 2020. The details of the 688 monitoring stations on the Indian Rivers with their latitude, longitude, district and states are enclosed as **Annexure-I**. WQ monitoring station is shown in GIS map as **Figure 5**.

**Figure 5: 688 Water quality stations monitored on important rivers covering all the major river basin of India.**

## 8. RESULTS AND DISCUSSION

Details of Indian rivers and their water quality monitoring stations where the water was found within acceptable limits in terms of toxic metal contamination as per (BIS 10500:2012) metal concentration during the study period is presented in **Annexure-II**. List of Indian rivers and their water quality monitoring stations and where the water was found above acceptable limits (BIS 10500:2012) metal concentration during the study period is presented in **Annexure-III**. Details of water quality monitoring stations where the water was found above the acceptable limit (BIS 10500:2012) in presence of only one parameter (Iron or Copper or Cadmium or Arsenic or Chromium or Nickel or Lead) during the study period is presented in **Annexure-IV**. Details of water quality monitoring stations where the water was found above the acceptable limit (BIS 10500:2012) in presence of more than one toxic metals during the study period is presented in **Annexure-V**. River wise summary and State-wise summary is given in **Annexure-VI** and **Annexure VII**, respectively.

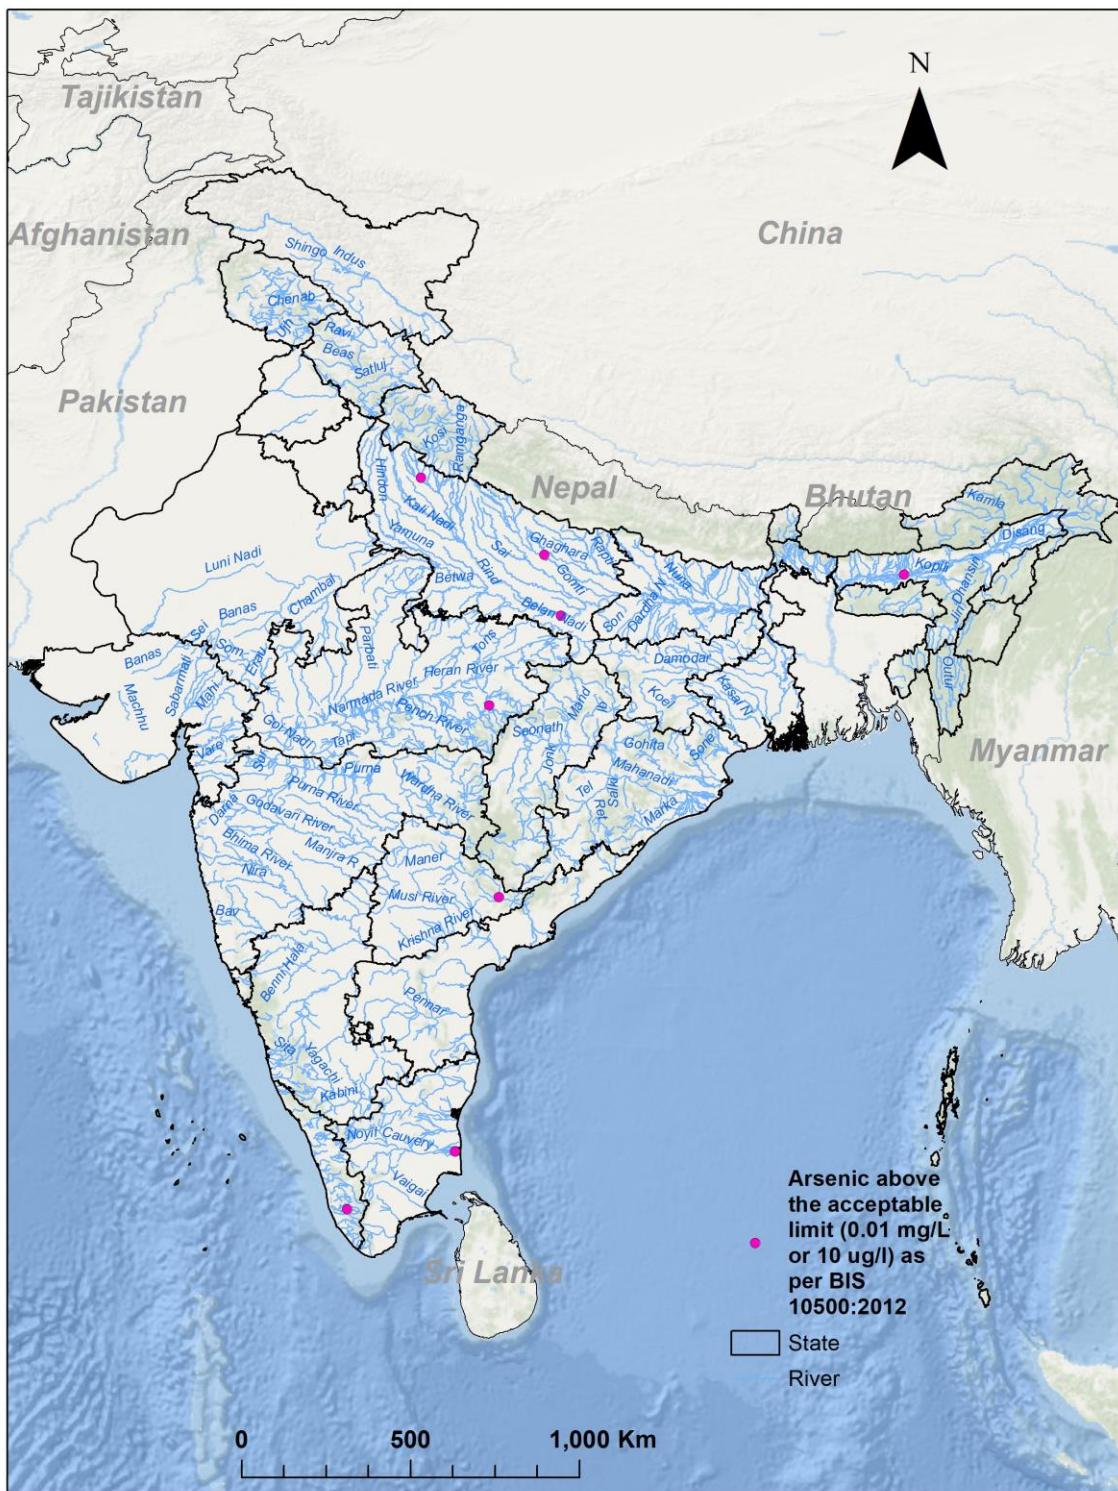

### Summary of ARSENIC content in Indian Rivers

BIS has recommended 0.01 mg/L (10 µg/L) as acceptable concentration of arsenic in drinking water. Total 2834 numbers of water samples were analysed and collected from 688 water quality monitoring stations for arsenic content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The arsenic concentration varies from 0.00 to 13.33 µg/L. Maximum arsenic concentration (13.33 µg/L) was observed at Porakudi water quality monitoring station on Arasalar River (a tributary of Cauvery River) during Dec, 2019. From reported data of all River water quality stations, it was found that arsenic concentration was above the acceptable limits at 8 sites.

It is also observed that, the acceptable limit exceeds only during non-monsoon period. **Table 11** shows the details of stations with respect to their river where Arsenic concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 6**.

**Table 11: Rivers and WQ monitoring stations where Arsenic exceeded the acceptable limits**

S.No.	Name Of Site	Month/Year	Arsenic (µg/L)	River	State	Latitude	Longitude

## **Summary of CADMIUM content in Indian Rivers**

BIS has recommended 0.003 mg/L (3 µg/L) as acceptable concentration of Cadmium in drinking water. Total 3113 numbers of water samples were analysed and collected from 688 water quality monitoring stations for cadmium content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The cadmium concentration varies from 0.00 to 12.57 µg/L. Maximum cadmium concentration (12.57 µg/L) was observed at Todarpur water quality monitoring station on Sukheta River during Dec, 2020. From reported data of all River water quality stations, it was found that cadmium concentration was above the acceptable limits at 11 sites.

Table 12 shows the details of stations with respect to their river where Cadmium concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 7**.

**Table 12: Rivers and WQ monitoring stations where Cadmium exceeded the acceptable limits.**

## Summary of CHROMIUM content in Indian rivers

BIS has recommended 0.05 mg/L (50 µg/L) as acceptable concentration of Chromium in drinking water. Total 3106 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Chromium content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The Chromium concentration varies from 0.00 to 180.47 µg/L. Maximum Chromium concentration (180.47 µg/L) was observed at M.B.P.L. water quality monitoring station on Hasdeo River during Dec, 2019. From reported data of all River water quality stations, it was found that Chromium concentration was above the acceptable limits at 46 sites.

**Table 13** shows the details of stations with respect to their river where Chromium concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 8**.

**Table 13: Rivers and WQ monitoring stations where Chromium exceeded the acceptable limits.**

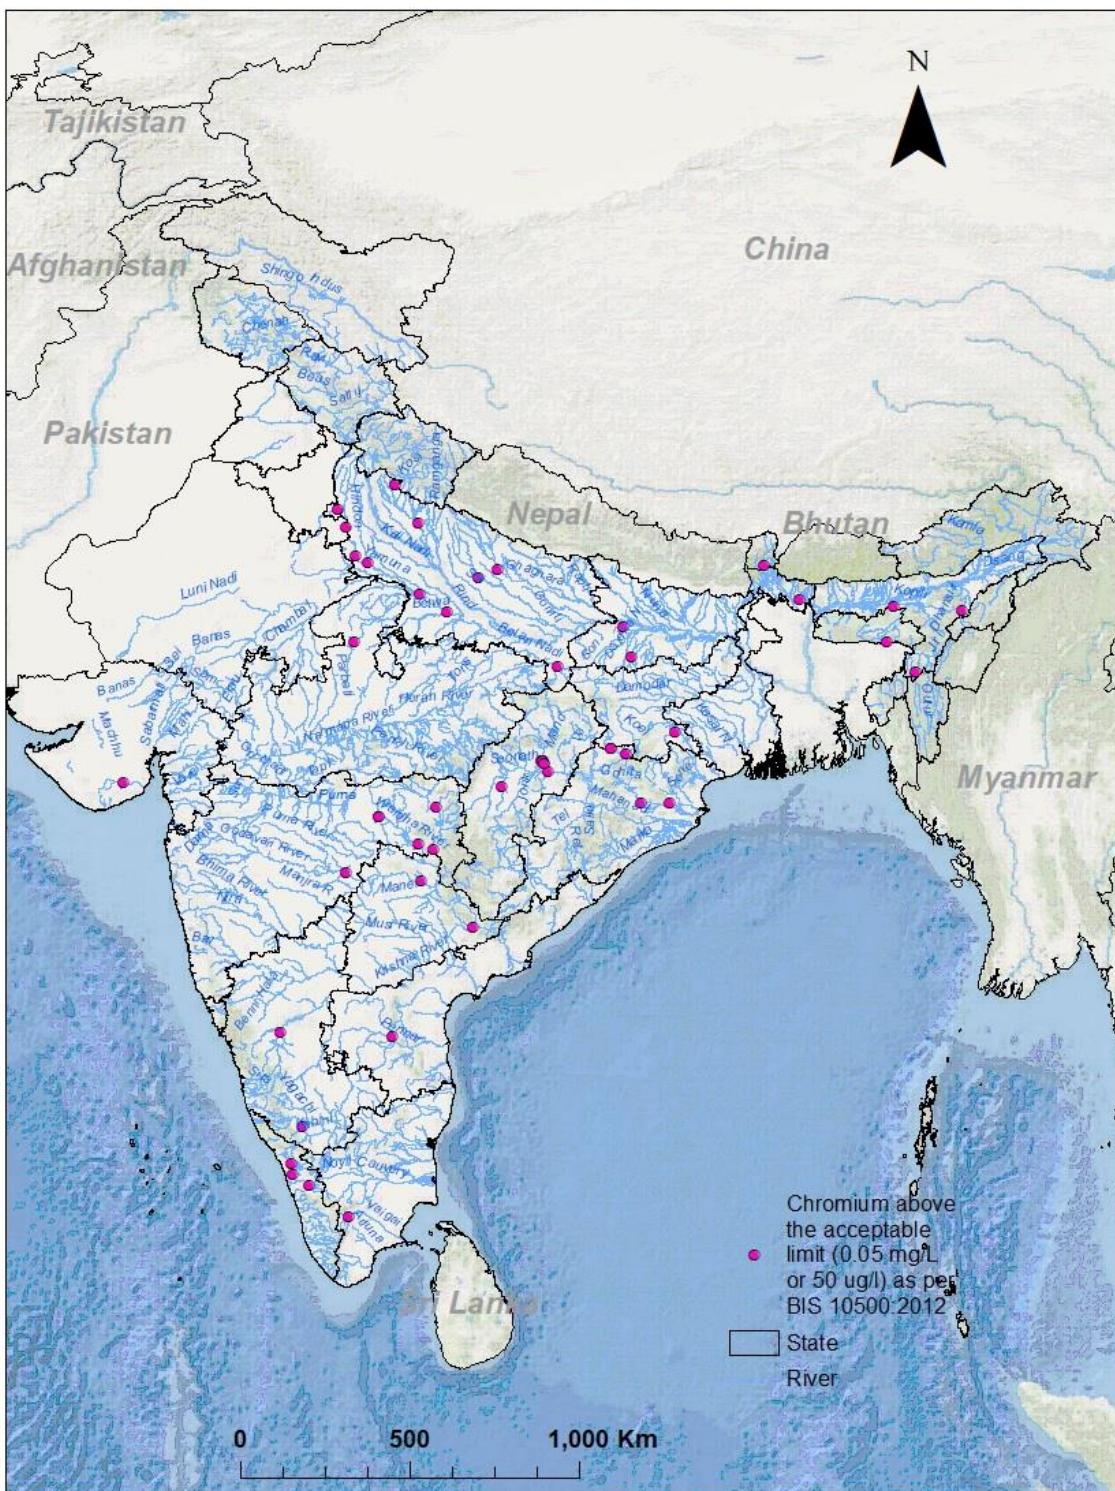

Figure 8: WQ monitoring stations where Chromium exceeded the acceptable limits

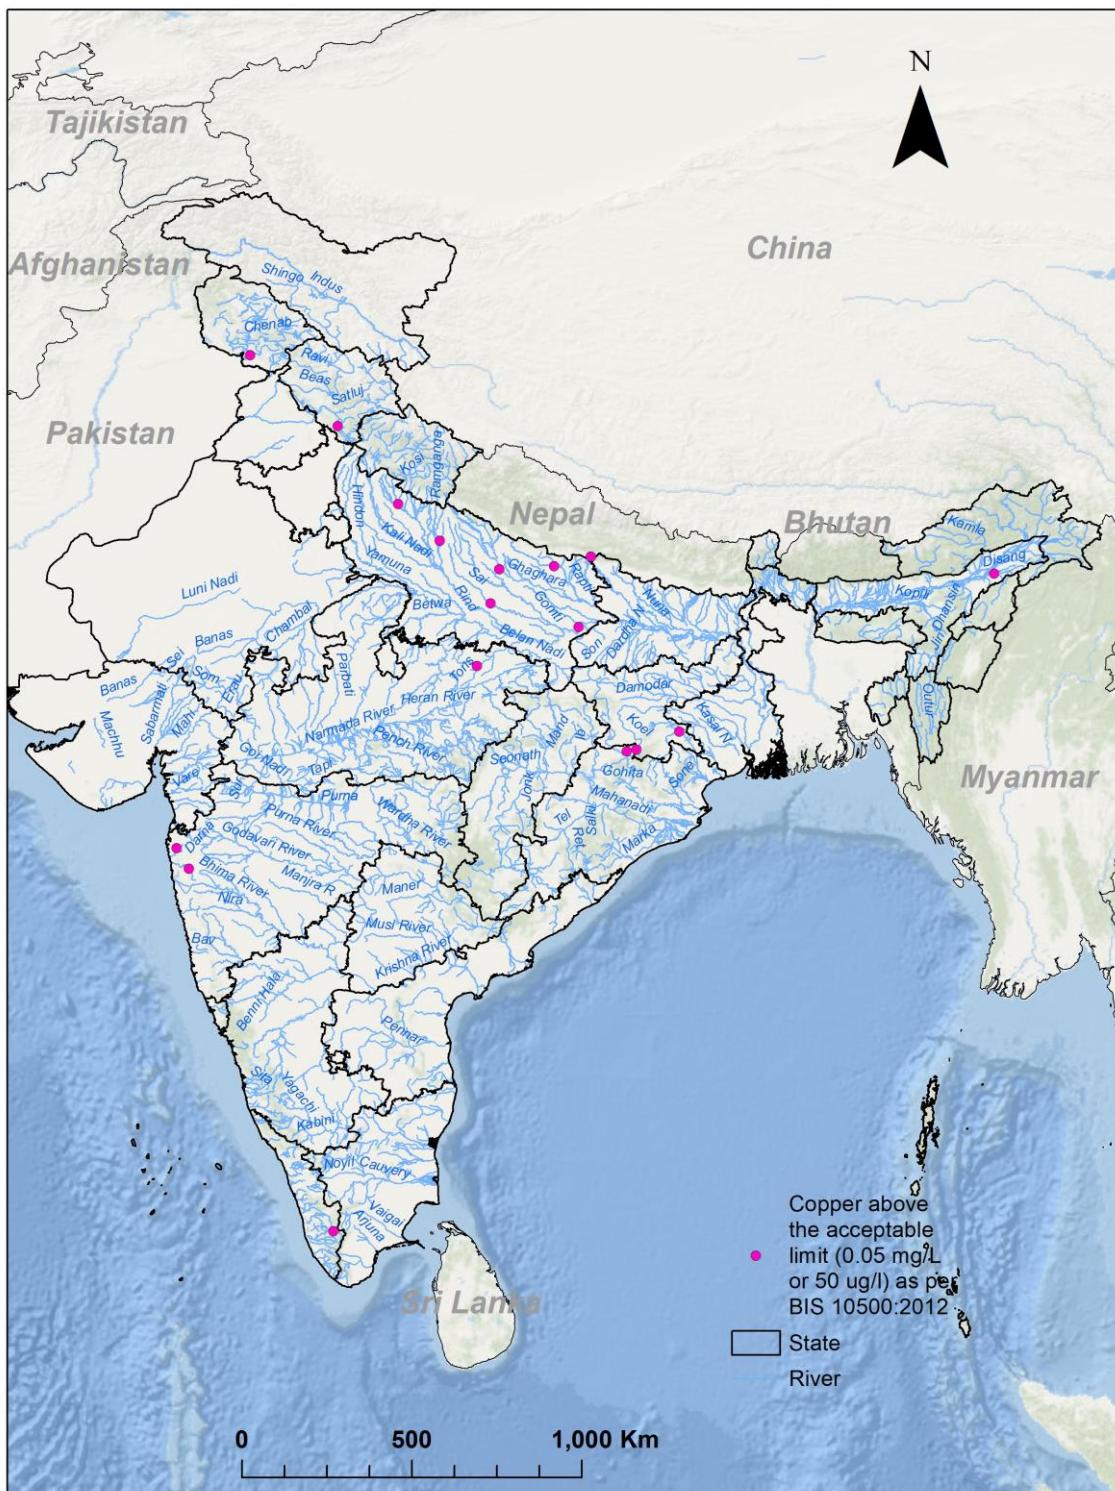

## Summary of COPPER content in Indian rivers

BIS has recommended 0.05 mg/L (50 µg/L) as acceptable concentration of Copper in drinking water. Total 3107 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Copper content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The Copper concentration varies from 0.00 to 132.64 µg/L. Maximum Copper concentration (132.64 µg/L) was observed at Badlapur water quality monitoring station on Ulhas River during Dec, 2019. From reported data of all River water quality stations, it was found that Copper concentration was above the acceptable limits at 17 sites.

**Table 14** shows the details of stations with respect to their river where Copper concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 9**.

**Table 14: Rivers and WQ monitoring stations where Copper exceeded the acceptable limits.**

## Summary of Lead content in Indian rivers

BIS has recommended 0.01 mg/L (10 µg/L) as acceptable concentration of Lead in drinking water. Total 3111 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Lead content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The Lead concentration varies from 0.00 to 67.55 µg/L. Maximum Lead concentration (67.55 µg/L) was observed at Chopan water quality monitoring station on Sone River during May, 2020. From reported data of all River water quality stations, it was found that Lead concentration was above the acceptable limits at 34 sites.

**Table 15** shows the details of stations with respect to their river where Lead concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 10**.

**Table 15: Rivers and WQ monitoring stations where Lead exceeded the acceptable limits.**

## Summary of Nickel content in Indian rivers

BIS has recommended 0.02 mg/L (20 µg/L) as acceptable concentration of Lead in drinking water. Total 3111 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Nickel content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The Nickel concentration varies from 0.00 to 242.90 µg/L. Maximum Nickel concentration (242.90 µg/L) was observed at Elunuthimangalam water quality monitoring station on Noyyal River during Dec, 2020. From reported data of all River water quality stations, it was found that Nickel concentration was above the acceptable limits at 199 sites.

**Table 16** shows the details of stations with respect to their river where Nickel concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 11**.

**Figure 11: WQ monitoring stations where Nickel exceeded the acceptable limits.**

## Summary of Iron content in Indian rivers

BIS has recommended 0.3 mg/L (300 µg/L) as acceptable concentration of Iron in drinking water. Total 3111 numbers of water samples were analysed and collected from 688 water quality monitoring stations for Iron content in Indian Rivers during the period Aug, 2018 to Dec, 2020. The Iron concentration varies from 0.00 to 11.24 mg/L. Maximum Iron concentration (11.24 mg/L) was observed at Farakka/(HR) water quality monitoring station on Feeder Canal during Aug, 2019. From reported data of all River water quality stations, it was found that Iron concentration was above the acceptable limits at sites.

**Table 17** shows the details of stations with respect to their river where Iron concentration exceeded the acceptable limits. WQ monitoring station is also shown in GIS map as **Figure 12**.

**Table 17: Rivers and WQ monitoring stations where Iron exceeded the acceptable limits**

**Figure 12: WQ monitoring stations where Iron exceeded the acceptable limits.**

## **Summary of Zinc content in Indian Rivers**

Zinc is an essential element for all living things, including man. Zinc-containing proteins and enzymes are involved in every aspect of metabolism, including the replication and translation of genetic material. BIS has recommended 5 mg/L (5000 µg/L) acceptable concentration of zinc in drinking water, which can be extended to 15 mg/L in case no alternative source of water is available, but the water with more than 5000 µg/L zinc content is not suitable for drinking purpose.

Total 3113 water samples from the 688 water quality monitoring stations were analyzed during the reporting period. Maximum Zinc concentration (1.70 mg/L) was observed at Belkheri water quality monitoring station on Sher River (Tributary of Narmada River) during May, 2020. In the study area, all the river water quality stations are reported to have zinc concentration well within the acceptable and permissible limits of Bureau of Indian Standards (BIS) and no toxicity of Zinc in the River waters is observed.

## 9. CONCLUSION

A comprehensive study of the results reveals that out of 688 River water quality stations monitored, water samples collected at 180 water quality stations are found within the permissible limit as far as toxic metals are concerned according to the BIS: 10500-2012 (**Figure 13**). While 187 stations were found beyond the permissible limit due to presence of two or more toxic metals (As/Cd/Cr/Cu/Pb/Ni/Fe).

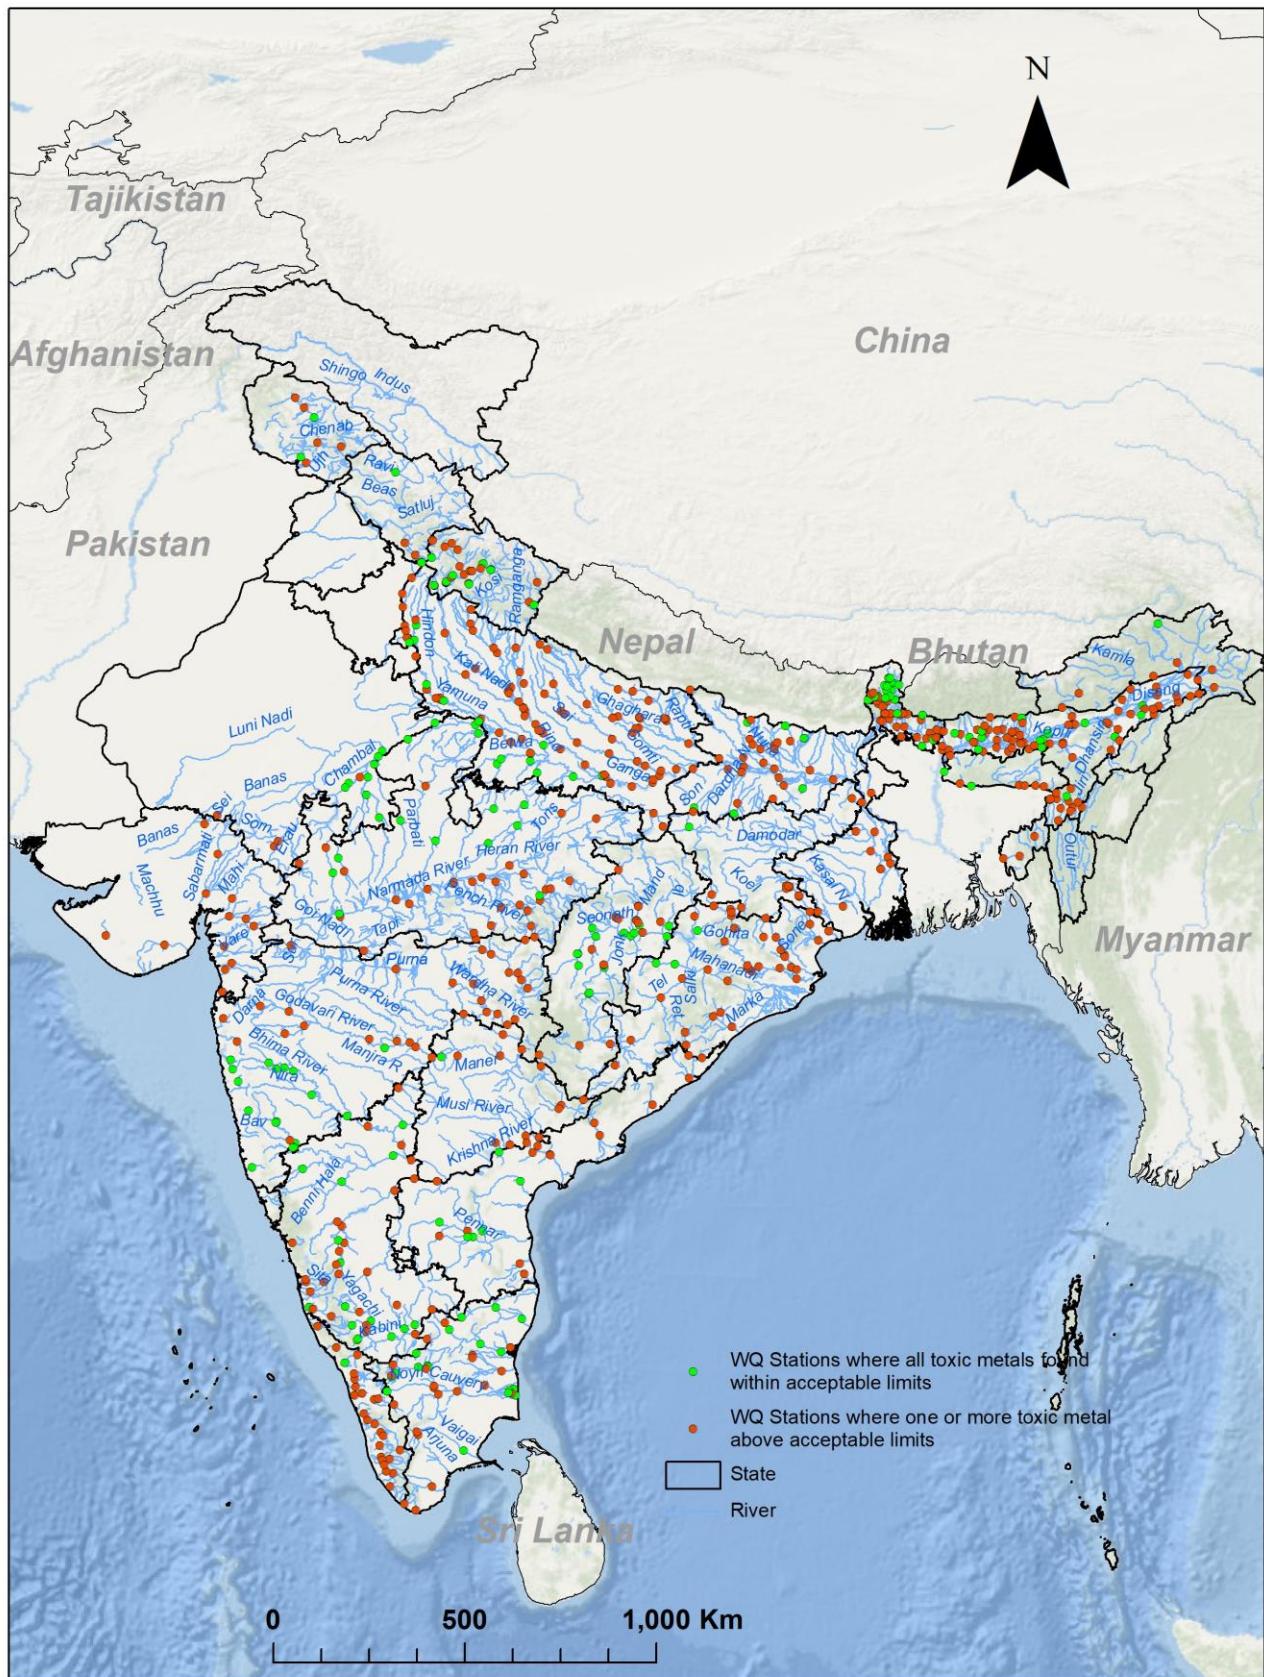

Further, river water at 240 numbers of stations was found beyond the acceptable limit with respect to only Iron concentration according to the BIS: 10500-2012. Similarly, river water is found beyond the acceptable limit at 2 stations due to presence of only arsenic, 2 stations due to presence of only copper, 1 station due to presence of only cadmium, at 7 stations due to presence of only Chromium, at 61 stations due to presence of only nickel and 8 stations due to presence of only lead contamination. Summary of contamination of different toxic metals are given in **Table 18 & 19**:

*Table 18: Analysis Statistic*

S. No	Metals	Total Analysed Samples	Total Contaminated Samples	Total Contaminated Stations
1	As	2834	8	8
2	Cd	3113	11	11
3	Cr	3106	50	46
4	Cu	3107	17	17
5	Pb	3111	36	34
6	Ni	3099	265	199
7	Fe	3113	756	414
8	Zn	3113	0	0

*Table 19: Summary*

S. No	Parameters	No. of Sites/Stations
1	Arsenic only	2
2	Cadmium only	1
3	Chromium only	7
4	Copper only	2
5	Lead only	8
6	Nickel only	61
7	Iron only	240
8	Two or More metals	187
<b>Total Contaminated WQ Stations</b>		<b>508</b>
<b>Total WQ Stations where all toxic metals found within acceptable limits</b>		<b>180</b>
<b>Total Stations studied</b>		<b>688</b>

## List of 688 Water Quality Monitoring Stations

S.No .	Name of Site	River	State	District	Basin	River/tributary	Latitude	Longitude
1	A.B.Road Crossing	Parwati	Madhya Pradesh	Guna	Ganga/Brahmaputra/Meghna/Barak	Ganga/Yamuna/ Chambal/Parwati	24.3658	77.0989
2	Abu Road	Banas	Rajasthan	Sirohi	West flowing rivers of Kutchh and Saurashtra including Luni	Banas	24.4939	72.7917
3	Addoor	Gurupur	Karnataka	Dakshina Kannada	West Flowing rivers from Tadri to Kanyakumari	Gurupur	12.9289	74.9539
4	Adityapur	Kharkai	Jharkhand	Purba Singhbhum	Subarnarekha	Subarnarekha/Kharkai	22.7914	86.1736
5	Agra (J.B.)	Yamuna	Uttar Pradesh	Agra (J.B)	Ganga/Brahmaputra/Meghna/Barak	Ganga/Yamuna	27.2039	78.0350
6	Agra (P.G.)	Yamuna	Uttar Pradesh	Agra(P.G)	Ganga/Brahmaputra/Meghna/Barak	Ganga/Yamuna	27.2542	78.0231
7	Aie NH Crossing	Aie	Assam	Barpeta	Ganga/Brahmaputra/Meghna/Barak	Aie	26.4975	90.6547
8	Akabarpur	Chhoti Sarju	Uttar Pradesh	Ambedkar Nagar	Ganga/Brahmaputra/Meghna/Barak	Ganga/Chhoti Sarju	26.4303	82.5619
9	Akhnoor	Chenab	Jammu & Kashmir	Jammu	Indus Basin	Chenab	32.9008	74.7589
10	Akhuapada	Baitarni	Odisha	Bhadrak	Brahmani-Baitarni	Baitarni	20.9156	86.2747
11	Akkihebbal	Hemavati	Karnataka	Mandy	Cauvery	Hemavati	12.6028	76.4028
12	Aklera	Parwan	Rajasthan	Jhalawar	Ganga/Brahmaputra/Meghna/Barak	Ganga/Yamuna /Chambal/Kalisindh/Parwan	24.4297	76.6039
13	Alandurai	Noyyal	Tamil Nadu	Coimbatore	Cauvery	Cauvery/Noyyal	10.9523	76.7853
14	Alladupalli	Kunderu	Andhra Pradesh	Kadapa	Pennar	Pennar/Kunderu	14.7172	78.6686
15	Altuma	Ramyala	Odisha	Dhenkanal	Brahmani-Baitarni	Brahmani/Ramyala	20.9297	85.5189
16	Amarpur	Gumti	Tripura	South Tripura	Ganga/Brahmaputra/Meghna/Barak	Meghna/Gumti	23.5244	91.6514
17	Ambarampalayam	Aliyar	Tamil Nadu	Coimbatore	West Flowing Rivers from Tadri to Kanyakumari	Bharathapuzha/ Kannadipuzha/ Aliyar	10.6303	76.9461
18	Ambari	Kaljani	West Bengal	Coochbehar	Ganga/Brahmaputra/Meghna/Barak	Kaljani	26.4164	89.5417
19	Ambasamudram	Vaigai	Tamil Nadu	Theni	East Flowing rivers between Pennar and Kanyakumari	Vaigai	9.9256	77.5117
20	Amgaon ( Bagdi)	Chulband	Maharashtra	Bhandara	Godavari Basin	Godavari/Pranhita/Wainganga/ Chulband	20.7783	79.8513
21	Amraghat	Sonai	Assam	Cachar	Ganga/Brahmaputra/Meghna/Barak	Sonai	24.6678	92.8924
22	Anakapalli	Sarada	Andhra Pradesh	Visakhapatnam	East Flowing rivers between Mahanadi and Pennar	Sarada	17.6800	83.0200
23	Anandpur	Baitarni	Odisha	Keonjhar	Brahmani-Baitarni	Baitarni	21.2111	86.1206

S.No	Name of Site	River	State	District	Basin	River/tributary	Latitude	Longitude
24	Andhiyarkhore	Hamp	Chattisgarh	Janjgir-champa	Mahanadi	Mahanadi/ Seonath/Hamp	21.8317	81.6058
25	Ankinghat	Ganga	Uttar Pradesh	Kanpur Nagar	Ganga/Brahmaputra/Meghna/Barak	Ganga	26.9347	80.0361
26	Anna Purna Ghat	Barak	Assam	Cachar	Ganga/Brahmaputra/Meghna/Barak	Barak	24.8189	92.7917
27	Annavasal	Nattar	Pondicherry	Karaikal	Cauvery	Cauvery/Nattar	10.9725	79.7556
28	Aradei	Aradei	Odisha	Keonjhar	Brahmani-Baitarni	Aradei	20.8595	86.4023
29	Arangaly	Chalakudy	Kerala	Thrissur	West Flowing rivers from Tadri to Kanyakumari	Periyar/Chalakudy	10.2814	76.3153
30	Arcot	Palar	Tamil Nadu	Ranipet	East Flowing rivers between Pennar and Kanyakumari	Palar	12.9139	79.3333
31	Arjunwad (Seasonal)	Krishna	Maharashtra	Kolhapur	Krishna	Krishna	16.7808	74.6333
32	Ashramam	Pazhayar	Tamil Nadu	Kanyakumari	West Flowing rivers from Tadri to Kanyakumari	Pazhayar	8.1593	77.4597
33	Ashti	Wainganga	Maharashtra	Gadchiroli	Godavari Basin	Godavari/Pranhita/Wainganga	19.6867	79.7839
34	Augustmuni D/S	Mandakani	Utrakhand	Rudraprayag	Ganga/Brahmaputra/Meghna/Barak	Mandakani	30.3922	79.0219
35	Augustmuni U/S	Mandakani	Utrakhand	Rudraprayag	Ganga/Brahmaputra/Meghna/Barak	Mandakani	30.4000	79.0417
36	Auraiya	Yamuna	Uttar Pradesh	Auraiya	Ganga/Brahmaputra/Meghna/Barak	Ganga/Yamuna	26.4272	79.4181
37	AVARANKUPPAM	Palar	Tamil Nadu	Vellore	East Flowing rivers between Pennar and Kanyakumari	Palar	12.6842	78.5394
38	Avershe	Seetha	Karnataka	Udupi	West Flowing rivers from Tadri to Kanyakumari	Seetha	13.5214	74.8800
39	Ayilam	Vamanapuram	Kerala	Thiruvananthapuram	West Flowing rivers from Tadri to Kanyakumari	Vamanapuram	8.7150	76.8500
40	Ayodhya	Ghaghra	Uttar Pradesh	Faizabad	Ganga/Brahmaputra/Meghna/Barak	Ganga/Ghaghra	26.8136	82.2078
41	Azmabad	Ganga	Bihar	Bhagalpur	Ganga/Brahmaputra/Meghna/Barak	Ganga	25.3275	87.2597
